C.A 8336
QUALI*STAR+*

THREE-PHASE ELECTRICAL NETWORKS ANALYSER

E N G L I S H   **User's manual**
CHAUVIN®
ARNOUX
CHAUVIN ARNOUX GROUP

Thank you for purchasing a **C.A 8336 three-phase electrical networks analyser (Qualistar+)**. To obtain the best service from your unit:
- **read** these operating instructions carefully,
- **comply** with the precautions for use.

⚠	WARNING, risk of DANGER! The operator must refer to these instructions whenever this danger symbol appears.		
▣	Equipment protected by double insulation.	🔒	Kensington anti-theft system.
⏚	Earth.	⌁	USB socket.
♻	The product is declared recyclable following a life cycle analysis in accordance with standard ISO 14040.		
CE	The CE marking indicates conformity with European directives, in particular LVD and EMC.		
	Chauvin Arnoux has adopted an Eco-Design approach in order to design this appliance. Analysis of the complete lifecycle has enabled us to control and optimize the effects of the product on the environment. In particular this appliance exceeds regulation requirements with respect to recycling and reuse.		
🗑	The rubbish bin with a line through it indicates that, in the European Union, the product must undergo selective disposal in compliance with Directive WEEE 2002/96/EC. This equipment must not be treated as household waste.		

Definition of measurement categories:
- Measurement category IV corresponds to measurements taken at the source of low-voltage installations.
  Example: power feeders, counters and protection devices.
- Measurement category III corresponds to measurements on building installations.
  Example: distribution panel, circuit-breakers, machines or fixed industrial devices.
- Measurement category II corresponds to measurements taken on circuits directly connected to low-voltage installations.
  Example: power supply to domestic electrical appliances and portable tools.

PRECAUTIONS FOR USE

This device is compliant with safety standard IEC 61010-2-030, the leads are compliant with IEC 61010-031, and the current sensors are compliant with IEC 61010-2-032, for voltages up to 600 V in category IV or 1,000 V in category III.
Failure to observe the safety instructions may result in electric shock, fire, explosion, and destruction of the instrument and of the installations.
- The operator and/or the responsible authority must carefully read and clearly understand the various precautions to be taken in use. Sound knowledge and a keen awareness of electrical hazards are essential when using this instrument.
- If you use this instrument other than as specified, the protection it provides may be compromised, thereby endangering you.
- Do not use the instrument on networks of which the voltage or category exceeds those mentioned.
- Do not use the instrument if it seems to be damaged, incomplete, or poorly closed.
- Do not use the instrument if the terminals or keyboard are wet. Dry it first.
- Before each use, check the condition of the insulation on the leads, housing, and accessories. Any item of which the insulation is deteriorated (even partially) must be set aside for repair or scrapping.
- Before using your device, check that it is perfectly dry. If it is wet, it must be thoroughly dried before being connected or being operated in any way.
- Use only the leads and accessories supplied. Using leads (or accessories) of a lower voltage or category reduces the voltage or category of the combined instrument + leads (or accessories) to that of the leads (or accessories).
- Use personal protection equipment systematically.
- Keep your hands away from the terminals of the device.
- When handling the leads, test probes, and crocodile clips, keep your fingers behind the physical guard.
- Use only the mains power adaptor and battery pack supplied by the manufacturer. They include specific safety features.
- Some current sensors must not be placed on or removed from bare conductors at hazardous voltages: refer to the sensor manual and comply with the handling instructions.

CONTENTS

1. GETTING STARTED

1.1. UNPACKING

No.	Designation	Quantity
①	Safety cables, black, banana-banana, straight-straight attached by a Velcro tie.	5
②	Black crocodile clips.	5
③	User's manual on CD-ROM.	1
④	Type A-B USB cord.	1
⑤	Specific mains power unit and mains cord.	1
⑥	No. 22 carrying bag	1
⑦	Sets of inserts and rings for marking the leads and current sensors according to phase.	12
⑧	Multilingual safety sheet.	1
⑨	Checking attestation.	1
⑩	Quick start guide.	1
⑪	Power Analyser Transfer (PAT) software on CD-ROM.	1
⑫	Battery.	1
⑬	C.A 8336 with or without current sensor depending on the order.	1

1.2. CHARGING THE BATTERY

Install the battery in the device (see quick start guide or § 17.3). Before the first use, start by fully charging the battery.

120 V ± 10 %, 60 Hz
230 V ± 10 %, 50 Hz
Remove the cover from the receptacle and connect the plug of the specific power supply unit to the device. Connect the mains cord to the power supply unit and to mains.

The button ⏻ lights; it will go out only when the plug is disconnected.
When the battery is fully discharged, charging takes approximately 5 hours.

1.3. CHOICE OF LANGUAGE

Before using the device, first choose the language in which you want the device to display its messages.

Press the green button to switch the device on.

Press the Configuration key.
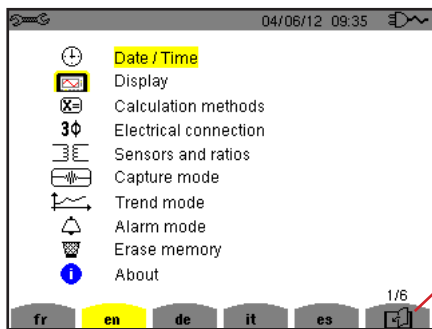

Press the yellow key on the device corresponding to the desired language.

This key is used to go to the next page.

Figure 8: Configuration screen

2. DESCRIPTION OF THE DEVICE

2.1. FUNCTIONS

The C.A. 8336 (Qualistar+) is a three-phase network analyzer with colour graphic display and built-in rechargeable battery.

It plays three roles, and can be used:
- to measure the RMS values, powers, and perturbations of electric distribution networks.
- to deliver a snapshot of the principal characteristics of a three-phase network
- to track the variations of various parameters over time.

The measurement uncertainty of the device is better than 1% (not counting the uncertainties due to the current sensors). The device is also very flexible, with a choice of sensors allowing measurements ranging from a few milliamperes (MN93A) to several kiloamperes (Amp*FLEX*™).

The device is compact and impact resistant.

The ergonomics and simplicity of its interface make using it pleasant.

The C.A 8336 is intended for the technicians and engineers of electrical installation and network inspection and maintenance teams.

2.1.1. MEASUREMENT FUNCTIONS

The principal measurements made are:
- The RMS values of AC voltages up to 1000 V between terminals. By using the ratios, the device can measure voltages up to hundreds of gigavolts.
- The RMS values of AC currents up to 10,000 amperes (neutral included). By using the ratios, the device can measure currents up to hundreds of kiloamperes.
- The DC components of voltages and currents (neutral included).
- Minimum and maximum half-cycle RMS voltage and current values (excluding neutral).
- Peak voltage and current values (neutral included).
- The frequency of 50 Hz and 60 Hz networks.
- Current and voltage peak factors (neutral included).
- Calculation of the harmonic loss factor (FHL), application to transformers in the presence of harmonic currents.
- Calculation of the K factor (KF), application to transformers in the presence of harmonic currents.
- Measurement of total harmonic distortion with respect to the fundamental (THD in % f) of the current and of the voltages (excluding neutral).
- Measurement of the total harmonic distortion with respect to the RMS AC value (THD in % r) for the current and the voltages (neutral included)
- Active, reactive (capacitive and inductive), non-active, distortion, and apparent power, by phase and cumulative (excluding neutral).
- Power factor (PF) and displacement factor (DPF or cos Φ) (excluding neutral).
- Measurement of the RMS distortion value (d) for the current and the voltages (excluding neutral).
- Short-term voltage flicker (PST) (excluding neutral).
- Measurement of the long-term flicker of the voltages (PLT) (excluding neutral).
- Active, reactive (capacitive and inductive), non-active, distortion, and apparent energy (excluding neutral).
- Current and voltage harmonics (excluding neutral) up to order 50: RMS value, percentage referred to the fundamental, (%f) (excluding neutral), or the total RMS value (%r), minimum and maximum and sequence harmonics.
- Apparent harmonic powe up to order 50 (excluding neutral): percentages referred to the fundamental apparent power (%f) or the total apparent power (%r), minimum and maximum of a rank.
- Inrush currents, starting of motors.

2.1.2. DISPLAY FUNCTIONS

- Display of waveforms (voltages and currents).
- Display of frequency bar chart (voltages and currents).
- Inrush Current function: displays parameters useful for study of the starting of a motor.
  - Instantaneous current and voltage at the instant designated by the cursor.
  - Maximum instantaneous absolute value of the current and of the voltage (over the entire starting time).
  - RMS value of the half-cycle (or lobe) of the current and voltage (excluding neutral) on which the cursor is positioned.
  - Maximum half-cycle RMS current (over the entire starting time).
  - Instantaneous network frequency at the instant designated by the cursor.
  - Maximum, mean, and minimum network frequencies (over the entire starting time).
  - Time at which starting of motor commenced.
- Screen captures (50 maximum).
- Transients function. Detection and recording of transients (up to 210) between user-defined start and stop dates and times. Recording of 4 complete cycles (one before the triggering event and three after) in the 8 acquisition channels.
- Trend recording (data logging) function. 2GB memory with date-stamping and user-defined start and stop dates for recording, with a maximum of 100 recordings. Display, in bar chart or curve form, of the means of many parameters vs. time, with or without minima and maxima.
- Alarm function. List of recorded alarms (up to 16,362) exceeding thresholds defined in the configuration menu. User-defined alarm monitoring start and stop times.

2.1.3. CONFIGURATION FUNCTIONS

- Date and time setting.
- Screen brightness setting.
- Choice of curve colours.
- Choice of management of switching off of the screen.
- Choice of display in night mode.
- Choice of calculation methods (non-active quantities broken down or not, choice of the unit of energy, choice of the coefficients of calculation of the K factor, choice of reference for the level of harmonics, PLT calculation (sliding or not).
- Choice of distribution system (single-phase, two-phase, three-phase with or without neutral) and of the connection method (standard, 2-element method or 2½-element method).
- Configuration of recording, alarms, inrush currents, and transients.
- Erasure of data (total or partial).
- Display of software and hardware version numbers.
- Choice of language.
- Display of current sensors detected not detected, not managed, simulated or impossible to simulate (2-element connection method) . Setting of voltage and current ratio, of the transduction ratios and of the sensitivity.

2.2. OVERALL VIEW

Measurement connection
terminals (see §2.6.1)

Figure 1: Overall view of Qualistar+
2.3. ON/OFF SWITCH

The device can operate either on its battery or on mains power. Pressing the 🔆 button powers up the device. . If the device is shut off suddenly (line power outage in the absence of the battery) or automatically (battery low), an information message is displayed when it is next started up.
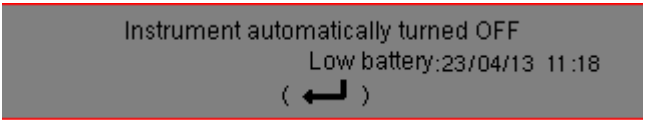

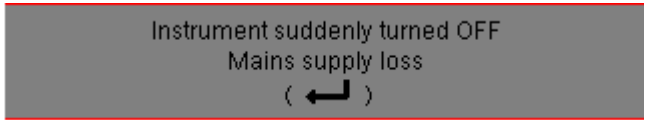

Pressing the 🔆 switch again turns the device off. If the device is recording, metering energy, or searching for transients, alarms, and/or inrush current acquisition, it requests confirmation.
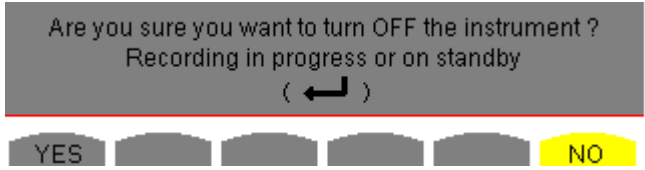

Select **Yes** or **No** on the corresponding yellow keys, then press the ↵ key to validate.
- If **No** is selected, recording will continue.
- If **Yes** is selected, the data recorded until that point are finalized and the device is turned off.

2.4. DISPLAY

2.4.1. PRESENTATION

The backlit 320x240 (1/4 VGA) pixel graphic TFT displays all measurements with their curves, the parameters of the unit, the curves selected, the instantaneous values of the signals, and the type of measurement selected. When the device is powered up, it automatically displays the *Waveform* screen. Information about this screen can be found in §7.

Reminder of the mode.

Active mode screen.

Function keys.

Battery charge level.

Current date and time.

Frequency calculated over one second.
Figure 2: example of a display screen

The management of switching off of the screen is chosen by the user in the Display Configuration Mode menu (see §4.4.3).

2.4.2. THE FUNCTION KEY ICONS

The display uses the following icons for the yellow function keys:

Icons	Designation
V	Phase-to-neutral voltage mode.
A	Phase-to-neutral current mode.
S	Power mode.
U	Phase-to-phase voltage mode.
var	Management of the breakdown of the non-active quantities.
Wh	Choice of unit of energy.
FK	Choice of coefficients of the K factor.
%f-%r	Choice of reference for the level of harmonics of the phases.
PLT	Management of the long-term flicker calculation mode.
CF	Display of the peak factors and of the curves.
RMS	Display of the RMS values and of the curves.
PEAK	Display of the PEAK values and of the curves.
THD	Display of the level of harmonic distortion and of the curves
PF…	Display of PF, cos Φ (DPF), tan Φ, and Φ.
W…	Display of powers and of the associated quantities (PF, cos Φ, DPF, tan Φ and Φ_{VA}).
Wh…	Display of the energy meters.
[Σ]	Activation and de-activation of the energy calculation.

Icons	Designation
⊕	Zoom in.
⊖	Zoom out.
◐	Management of the contrast.
▬	Choice of colours of the measurement channels.
⬤	Management of the switching off of the screen
☾	Display in night mode.
🖫	Recording programming mode.
🗁	Recording look-up mode.
▶	Start of recording.
⇶▶	Rapid programming and start of recording.
⏸	Disconnection of recording.
✋	Shut down function in progress prompt.
🗑	Bin for deletions of elements.
⚲	Shortcut to the recording parameterizing mode
▼	Activate/deactivate selection of the transients list display filter.

Icons	Designation		Icons	Designation
⊤	Display of mean values and extrema.		●	Select all items.
›V↑‹	Move the cursor to the first occurrence of the maximum phase-to-neutral voltage.		○	Unselect all items.
›V↓‹	Move the cursor to the first occurrence of the minimum phase-to-neutral voltage.		⌒	Transient mode.
›U↑‹	Move the cursor to the first occurrence of the maximum phase-to-phase voltage.		⊞	Inrush current mode.
›U↓‹	Move the cursor to the first occurrence of the minimum phase-to-phase voltage.		∡⊗	Display of Fresnel diagram of the signals.
›A↑‹	Move the cursor to the first occurrence of the maximum current.		>t=0<	Move cursor to transient triggering time.
›A↓‹	Move the cursor to the first occurrence of the minimum current.		>t=-T<	Move the cursor to one signal period before the triggering date of the transient.
›Hz↑‹	Move the cursor to the first occurrence of the maximum instantaneous frequency.		⌾→	Energies consumed by the load.
›Hz↓‹	Move the cursor to the first occurrence of the minimum instantaneous frequency.		⌾←	Energies generated by the load.
›↑‹	Move the cursor to the first occurrence of the maximum of the measurement displayed.		?①	Page screen 1 of the help function.
›↓‹	Move the cursor to the first occurrence of the minimum of the measurement displayed.		?②	Page screen 2 of the help function.
▐▐▐	Simultaneous display of all voltage and current measurements (RMS, DC, THD, CF, PST, PLT, FHL, FK).		?③	Page screen 3 of the help function.
			?④	Page screen 4 of the help function.
			⊟	Previous configuration.
			⊕	Next configuration.
			⟨	Previous page screen.
			⟩	Next page screen.

2.5. KEYPAD KEYS

2.5.1. FUNCTION KEYS (YELLOW KEYS)

These 6 keys activate the function or tool represented by the corresponding icon on the screen.

2.5.2. NAVIGATION KEYS

A block of 4 arrow keys, a select key and a return key are used for navigation in the menus.

Item	Function
▲	Up direction or navigation key.
▼	Down direction or navigation key.
▶	Right direction or navigation key.
◀	Left direction or navigation key.
↵	Confirms the selection.
↩	Return key.

2.5.3. MODE KEYS (VIOLET KEYS)

These give access to specific modes:

Item	Function	See
	Waveform acquisition mode, with two sub-modes: transients mode (blackouts, interference, etc.) and inrush current mode (starting of motor).	§ 5
	Harmonic curves display mode: representation of voltage, current, and power harmonics, order by order; determination of harmonic currents produced by nonlinear loads, analysis of problems caused by harmonics according to their order (overheating of neutrals, conductors, motors, etc.).	§ 6
	Display of voltage and current waveforms, display of minima and maxima of summary tables, determination of phase rotation.	§ 7
	Alarm mode: list of recorded alarms exceeding the thresholds programmed in the configuration; recording of network blackouts with half-cycle resolution (Vrms, Arms, Urms), determination of energy consumption overshoots, monitoring of compliance with a power supply quality contract.	§ 8
	Trend mode: recording of the parameters selected in the Configuration menu.	§ 9
	Display of power and energy measurements	§ 10

Three keys are real-time mode keys: W , l... and ◠ .

In each of these modes, the coloured circles on a white ground ①, in which the channel numbers or types are entered, are indicators of saturation: the ground of the circle is coloured when the channel measured is potentially full ❶.

When the identification disc corresponds to a simulated channel (for example in 4-wire three-phase with selection V1V2, 2½-element method, or in 3-wire three-phase with selection A1A2, 2-element method; see connections in §4.6), this channel is potentially full if at least one channel used in calculating it is potentially full.
Similarly, if the saturation disc corresponds to a phase-to-phase voltage channel, it is potentially full if at least one of the phase-to-neutral voltage channels used in calculating it is potentially full.

2.5.4. OTHER KEYS

The other keys have the following functions:

Item	Function	See
	Configuration key.	§ 4
	Snapshot of current screen and retrieval of screens already stored.	§ 11
?	Help key: provides information about the functions and the symbols used for the current display mode.	§ 12

2.6. CONNECTORS

2.6.1. CONNECTION TERMINALS

Located on the top of the device, these connectors are distributed as follows:

4 current input terminals for current sensors (MN clamp, C clamp, Amp*FLEX*™, PAC clamp, E3N clamp, etc.).

5 voltage input terminals.
Figure 3: the connection terminals

2.6.2. SIDE CONNECTORS

Located on the right side of the device, these connectors are used as follows:

Theft-prevention device. It is used to secure the device with padlock.

USB connector. For connection to a PC.

Mains power connector: Recharges the battery and allows operation on mains power.
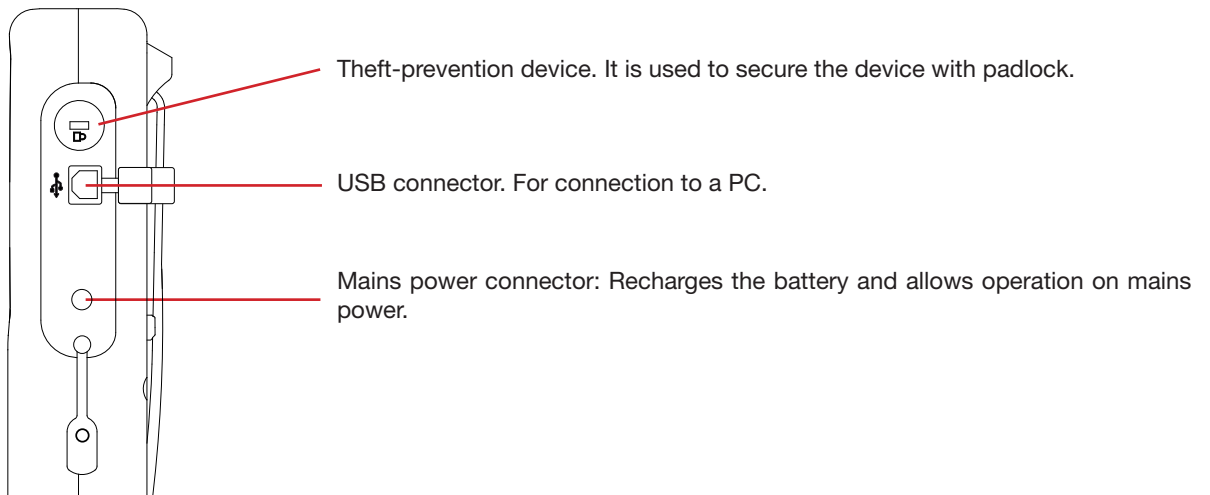

Figure 4: the side connectors

2.7. POWER SUPPLY

The battery icon in the top right corner of the screen shows the battery level. The number of bars is proportional to the charge level.

▮▮▮▮	Battery charged.
▮▯▯	Low battery.
▮▮▮	Mobile bars: battery charging.
▮▮	A red bar: the condition of the battery is unknown because it has never been fully charged.
⊐⌁	The device is connected to mains without the battery.

When the battery level is too low, the following message is displayed:

Low battery
Instrument will soon turn OFF
↵
Press ↵ to confirm the information. If you do not connect the device to mains, it switches itself off one minute after this message. It is therefore necessary to start charging it as soon as possible.

2.8. THE STAND

A retractable stand on the back of the Qualistar+ can be used to hold the device in a tilted position.

Retractable stand.
Battery.

Figure 5: stand and battery compartment cover

2.9. ABBREVIATIONS

Prefixes of International System (SI) units

Prefix	Symbol	Multiplies by
milli	m	10^{-3}
kilo	k	10^{3}
Mega	M	10^{6}
Giga	G	10^{9}
Tera	T	10^{12}
Peta	P	10^{15}
Exa	E	10^{18}

Meanings of the symbols and abbreviations used:

Symbol	Designation
$\simeq$	AC and DC components.
$\sim$	AC component only.
$=$	DC component only.
⌐	Inductive phase shift.
⌐	Capacitive phase shift.
°	Degree.
-.+	Expert mode.
| |	Absolute value.
Σ	Sum of values.
%	Percentage.
%f	Fundamental value as reference
%r	Total value as reference
Φ_{VA} or Φ_{UA}	Phase shift of voltage with respect to current.
A	Current; also Ampere (unit).
A-h	Current harmonic.
Acf	Crest (peak) factor of current.
Ad	RMS distortion current.
Adc	DC current.
Apk+	Maximum peak value of the current.
Apk-	Minimum peak value of the current.
Arms	True RMS current.
Athdf	Total harmonic distortion of current in % f.
Athdr	Total harmonic distortion of current in % r.
Aunb	Negative-sequence current unbalance rate.
AVG	Mean value (arithmetic mean).
CF	Peak factor (current or voltage).
cos Φ	Cosine of the phase shift of voltage with respect to current (DPF – fundamental power factor or displacement factor).
DC	DC component (current or voltage).
DPF	Displacement factor (cos F).
FHL	Harmonic loss factor.
FK	K factor.
Hz	Frequency of network studied.
L	Channel (Line).
MAX	Maximum value.
MIN	Minimum value.
ms	Millisecond.
PEAK or PK	Maximum (+) or minimum (-) peak instantaneous value of the signal.
PF	Power factor.
PLT	Long-term flicker.
PST	Short-term flicker.
RMS	True RMS value (current or voltage).

Symbol	Designation
t	Relative date of time cursor.
tan Φ	Tangent of the phase shift of voltage with respect to current.
THD	Total harmonic distortion (in %f or in %r).
U	Phase-to-Phase voltage.
U-h	Phase-to-phase voltage harmonic.
Ucf	Phase-to-Phase voltage crest factor.
Ud	Phase-to-phase RMS distortion voltage.
Udc	Phase-to-phase DC voltage.
Upk+	Maximum peak value of the phase-to-phase voltage.
Upk-	Minimum peak value of the phase-to-phase voltage.
Urms	True RMS phase-to-phase voltage.
Uthdf	Total phase-to-phase voltage harmonic distortion in %f.
Uthdr	Total phase-to-phase voltage harmonic distortion in %r.
Uunb	Negative-sequence phase-to-phase voltage unbalance rate.
V	Phase-to-neutral voltage; also Volt (unit)
V-h	Phase-to-neutral voltage harmonic.
S	Apparent power.
S-h	Apparent harmonic power.
D	Distortion power.
Dh	Distortion energy.
Sh	Apparent energy.
Q_1	Reactive power (fundamental).
N	Non-active power
Q_1h	Reactive energy (fundamental).
Nh	Non-active energy.
Vcf	Peak factor of the phase-to-ground voltage.
Vd	Phase-to-neutral RMS distortion voltage.
Vdc	Phase-to-neutral DC voltage.
Vpk+	Maximum peak value of the phase-to-neutral voltage.
Vpk-	Minimum peak value of the phase-to-neutral voltage.
Vrms	True RMS phase-to-neutral voltage.
Vthdf	Total harmonic distortion of phase-to-neutral voltage in %f.
Vthdr	Total harmonic distortion of phase-to-neutral voltage in %r.
Vunb	Negative-sequence phase-to-ground voltage unbalance rate.
P	Active power.
Pdc	DC power.
Pdch	DC energy.
Ph	Active energy.

3.1. START-UP

To switch the device on, press the ⬢ button. It lights when pressed, then goes off if the mains power unit is not connected to the device.

After the software check, the home page is displayed, then the information screen that indicates the software version of the device and its serial number.

Figure 6: Home page at start-up

Then the *Waveform screen* is displayed.
Figure 7: Waveform screen

3.2. CONFIGURATION

To configure the device, proceed as follows:
- Press ⚲. The configuration screen appears.
- Press ▲ or ▼ to select the parameter to be modified. Press ↵ to enter the selected sub-menu.
Figure 8: Configuration screen

Then use the arrow keys (▲ or ▼ and ◄ or ►) and the ↵ key to validate. For more details, see §§4.3 to 4.10.

The following points must be checked or adapted for each measurement:
- Define the parameters of the calculation methods (see §4.5).
- Select the distribution system (single-phase to five-wire three-phase) and the connection method (2 wattmeters, 2 ½ elements, standard) (see §4.6).
- Program the current ratios according to the type of current sensor connected (see §4.7).
- Program the voltage ratios (see §4.7).
- Define the triggering levels (transients mode and inrush current capture) (see §4.8).
- Define the values to be recorded (trend mode) (see §4.9).
- Define the alarm thresholds (see §4.10).

To return to the *Configuration* screen from a sub-menu, press the ⤺ key.

3.3. INSTALLATION OF LEADS

To identify the leads and input terminals, you may mark them in accordance with the usual phase/neutral colour code using the coloured rings and inserts supplied with the device.
- Detach the insert and place it in the hole provided for it near the terminal (large insert for a current terminal; small insert for a voltage terminal).

Large insert for current terminal.

Small insert for voltage terminal.

Rings the same colour as the terminal.
- Clip rings of the same colour to the ends of the lead you will be connecting to the terminal.
  Twelve sets of rings and inserts of different colours are provided to enable you to harmonize the device with any of the phase/neutral colour codes in force.

- Connect the measurement leads to the terminals of the device:

4 current inputs terminals.

5 voltage input terminals.
Figure 3: connection terminals

- Remember to define the transformation ratios of the current sensors and of the voltage inputs (see §4.7).

To make a measurement, you must program at least:
- the calculation method (see §4.5),
- the connection (see §4.6)
- and the ratios of the sensors (see §4.7).

The measuring leads must be connected to the circuit to be measured as shown by the following diagrams.

3.3.1. SINGLE-PHASE NETWORK
Figure 9: 2-wire single-phase connection
Figure 10: 2-wire single-phase connection

3.3.2. SPLIT-PHASE NETWORK
Figure 11: 2-wire split-phase connection
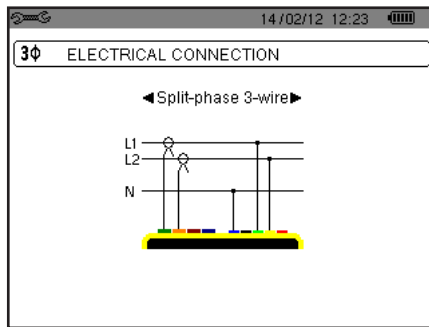

Figure 12: 3-wire split-phase connection
Figure 13: 4-wire split-phase connection

3.3.3. THREE-PHASE NETWORK
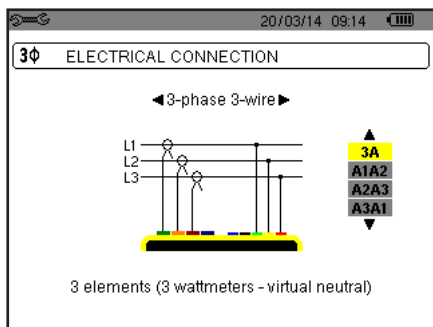

Figure 14: 3-wire three-phase connection
Figure 15: 4-wire three-phase connection
Figure 16: 5-wire three-phase connection

In the case of a three-phase network, you are not obliged to connect all of the terminals in voltage or in current.

For 3-wire three-phase, indicate the current sensors that will be connected: all 3 sensors (3A) or only 2 (A1 and A2, or A2 and A3, or A3 and A1).
For 4- and 5-wire three-phase, indicate the voltages that will be connected: all 3 voltages (3V) or only 2 (V1 and V2, or V2 and V3, or V3 and V1).

3.3.4. CONNECTION PROCEDURE

- Switch the instrument on.
- Configure the device for the measurement to be made and the type of network concerned (see §4),
- Connect the leads and current sensors to the unit.
- Connect the earth and/or neutral lead to the network earth and/or neutral (when it is distributed) and connect the corresponding current sensor,
- Connect the L1 phase lead to the network L1 phase and connect the corresponding current sensor.
- If applicable, repeat the procedure for phases L2 and L3 and for N.

Note: complying with this procedure reduces connection errors to a minimum and avoids wasting time.

Disconnection procedure:
- Proceed in the reverse of the order of connection, always finishing by disconnecting the neutral (when distributed).
- Disconnect the leads and switch the device off.

3.4. FUNCTIONS OF THE DEVICE

Any screen can be saved (screen snapshot) by pressing the 📷 key for 3 seconds (see §11).

You can press the help key ❓ at any time. The help screen will inform you about the functions and the symbols used for the current display mode.

3.4.1. WAVEFORM CAPTURE

With the device powered up and connected to the network, press ▭.
You can display the Transients mode (see §5.1) or the Inrush current mode (see §5.2).

3.4.2. DISPLAY OF HARMONICS

With the device powered up and connected to the network, press ▭.
You can display the phase-to-neutral voltage (see §6.1), the current (see §6.2), the apparent power (see §6.3) or the phase-to-phase voltage (see §6.4).

3.4.3. WAVEFORM MEASUREMENTS

With the device powered up and connected to the network, press ▭.

You can display the measurements of the true RMS value (see §7.1), the measurements of the total harmonic distortion (see §7.2), the measurements of the peak factor (see §7.3), the extreme values in voltage and current (see §7.4), several values at once (see §7.5), or the Fresnel diagram (see §7.6).

3.4.4. ALARM RECORDING

With the device powered up and connected to the network, press ▭.

You can configure the alarm mode (see §8.1), program an alarm campaign (see §8.2), look it up (see §8.4), or erase it (see §8.6).

3.4.5. RECORDING

With the device powered up and connected to the network, press ▭.
You can configure recordings (see §9.2) and program them (see §9.1). You can also look up or erase recordings (see §4.11).

3.4.6. ENERGY MEASUREMENTS

With the device powered up and connected to the network, press ▭.
You can measure the energies consumed (see §10.1.3) or generated (see §10.1.4, §10.2.2, or §10.3.2).

4. CONFIGURATION

The *Configuration* key ✎ is used to configure the device. This must be done before each new type of measurement. The configuration remains in memory, even after the device is switched off.

4.1. CONFIGURATION MENU

The arrow keys (▲,▼, ◄, ►) are used to navigate in the Configuration menu and to parameterize the device.
A value that can be modified is flanked by arrows.

Most of the time, confirmation (↵) is necessary for the changes made by the user to be applied.

The return key (⮌) is used to return to the main menu from a sub-menu.
Figure 8: the Configuration screen

4.2. DISPLAY LANGUAGE

To select the display language, press the yellow key under the corresponding icon on the screen (Figure 6).

The active language is identified by the icon on the yellow ground.

4.3. DATE/TIME

The ⊕ menu defines the system date and time. The display is as follows:
Figure 17: Date/Time menu

With the Date/Time field highlighted in yellow, press ↵ . To change a value, press ▲ or ▼. To move from one field to another, press ◄ or ►. To confirm, press ↵ .

Proceed in the same way for the dating system (DD/MM/YY or MM/DD/YY) and the time system (12/24 or AM/PM). You see the effect immediately in the display of the date.

To return to the Configuration menu, press ⮌.

Note: The date and time parameters cannot be configured while the device is recording, metering energy, or searching for transients, alarms, and/or inrush current acquisition.

4.4. DISPLAY

4.4.1. BRIGHTNESS

The ◑ menu is used to define the brightness of the display unit. The display is as follows:
Figure 18: the Contrast/Brightness menu

Use the keys (◄, ►) to change the brightness.
To return to the Configuration menu, press ⤺.

4.4.2. COLOURS

The ▤ menu is used to define the colours of the voltage and current curves. Press the yellow key corresponding to the ▤ icon. There are 15 colours available: green, dark green, yellow, orange, pink, red, brown, blue, turquoise blue, dark blue, very light grey, light grey, grey, dark grey, and black.

The display is as follows:
Figure 19: the Colours menu

Use the arrow keys (▲, ▼, ◄, ►) to change the assignments of the colours.
To return to the Configuration menu, press ⤺.

4.4.3. MANAGEMENT OF THE SWITCHING OFF OF THE SCREEN

The ⬤ menu defines the management of the switching off of the screen. Press the yellow key corresponding to the ⬤ icon.

Figure 124: the Management of Switching off of the Screen menu

Use the arrow keys (▲, ▼) to choose the screen switching off mode: Automatic or Never.

The Automatic mode is used to save the battery. The display screen is switched off automatically after five minutes without action on the keys if the device is powered only by its battery and if recording is in progress and after ten minutes if no recording is in progress. The On/Off button ▲ blinks to indicate that the device is still in operation. Pressing any key on the keypad relights the screen.

To return to the Configuration menu, press ⮐.

4.4.4. NIGHT MODE

The ☾ menu is used to change to night mode. Press the yellow key corresponding to the ☾ icon.
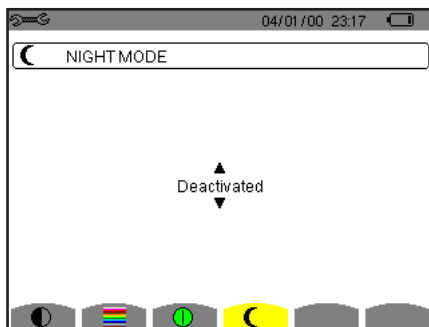

Figure 125: the night Mode menu

Use the navigation keys (▲,▼) to activate or deactivate night mode. The screen then changes to reverse video and all colours are changed.

4.5. CALCULATION METHODS

The menu ⊠ defines:
- The choice of breakdown or no breakdown of the non-active quantities,
- The choice of unit of energy,
- The choice of reference for the level of harmonics of the phases,
- The choice of coefficients of calculation for the K factor,
- The choice of method of calculation of the long-term flicker.

4.5.1. CHOICE OF CALCULATION OF NON-ACTIVE QUANTITIES

The **var** menu is used to choose whether or not to break down the non-active quantities (powers and energies).
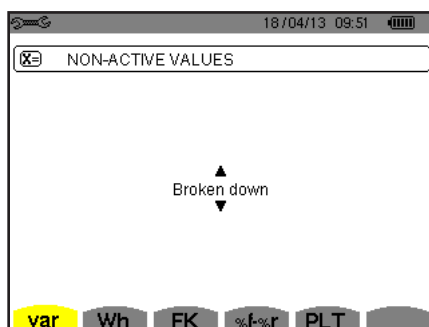

Figure 20: the Methods of Calculation of Reactive Quantities menu

Use the arrow keys (▲,▼) to select broken down or not.
- Broken down: Non-active power N is broken down into reactive power (fundamental) Q_1 and distorting power D. Non-active energy Nh is broken down into Q_1h and Dh.
- Not broken down: Non-active power N and non-active energy Nh are displayed.

Then validate with the ⮐ key. The device returns to the *Configuration* menu.

Note: The modification is impossible if the device is recording, metering energy, and/or searching for alarms.

4.5.2. CHOICE OF UNIT OF ENERGY

The **Wh** menu defines the unit of display of energies.
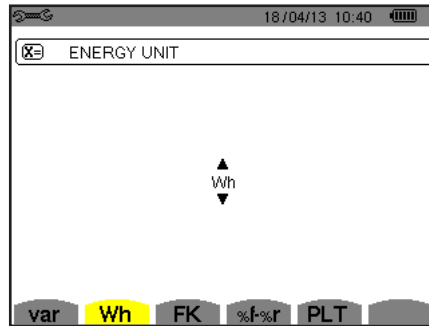

Figure 21: the Choice of Unit of Energy menu

Use the arrow keys (▲,▼) to select the unit:
- Wh : watt-hour.
- J: joule.
- toe (nuclear): nuclear tonne oil equivalent.
- toe (non-nuclear): non-nuclear tonne oil equivalent.
- BTU: British Thermal Unit.

Then validate with the ↵ key . The device returns to the *Configuration* menu.

4.5.3. CHOICE OF COEFFICIENTS OF CALCULATION OF THE K FACTOR

The **FK** menu defines the coefficients used for the calculation of the K factor.
Figure 22: the Choice of coefficients of calculation of the K factor menu

Use the arrow keys (▲,▼, ◄, ►) to fix the value of coefficients q and e:
- q: exponential constant that depends on the type of winding and the frequency.
  The value of q can range from 1.5 to 1.7. The value of 1.7 is suitable for transformers having round or square conductors, in all types of winding. The value of 1.5 is suitable for those in which the low-voltage windings are in tape form.
- e: ratio between the losses linked to eddy currents (at the fundamental frequency) and resistive losses (both evaluated at the reference temperature). The value of e can range from 0.05 to 0.1.

The default values (q = 1.7 and e = 0.10) are suitable for most applications.

Then validate with the ↵ key. The device returns to the *Configuration* menu.

Note: The modification is impossible if the device is recording and/or searching for alarms.
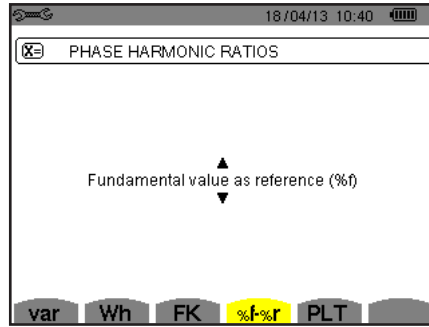

Figure 23: the Choice of Reference for the Level of Harmonics menu

Use the arrow keys (▲,▼) to fix the reference for the level of harmonics:
- %f: the reference is the value of the fundamental.
- %r: the reference is the total value.

Then validate with the ↵ key. The device returns to the *Configuration* menu.

In the case of the level of harmonics of the V-h, A-h, and U-h phases, the fundamental and total values are RMS values. In the case of the level of harmonics of the S-h phases, the fundamental and total values are apparent power values.

Note: The modification is impossible if the device is recording and/or searching for alarms.

4.5.5. CHOICE OF METHOD OF CALCULATION OF PLT

The **PLT** menu defines the method used to calculate the PLT (long-term flicker).

Figure 24: the Choice of Method of Calculation of PLT menu

Use the arrow keys (▲,▼) to choose sliding or non-sliding.
- T is calculated every 10 minutes. The first value is availa3t76522

4.6. CONNECTION

The **3Φ** menu is used to define how the device is connected, according to distribution system.
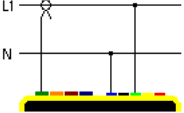

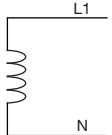

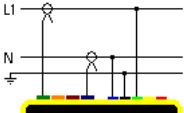

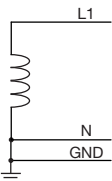

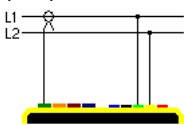

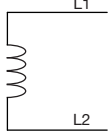

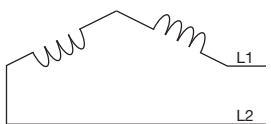

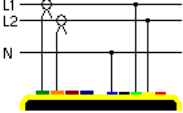

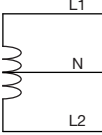

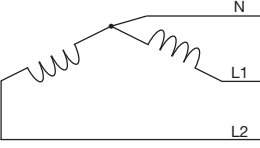

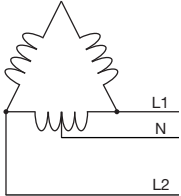

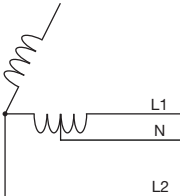

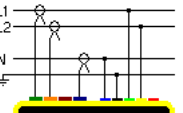

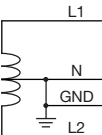

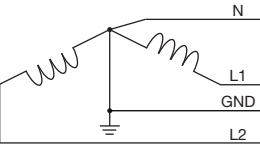

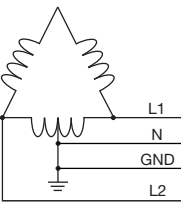

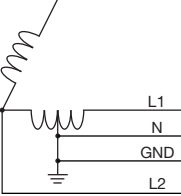

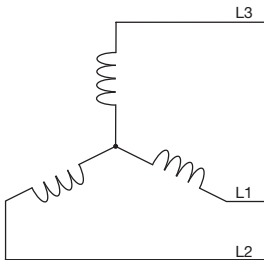

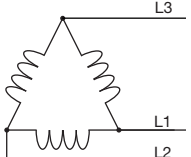

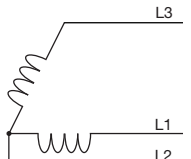

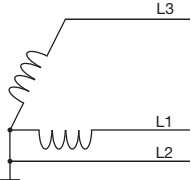

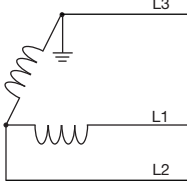

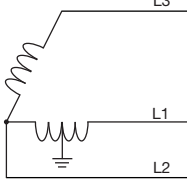

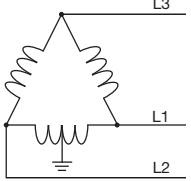

Figure 16: the Connection menu
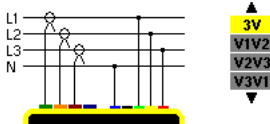

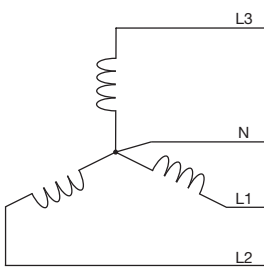

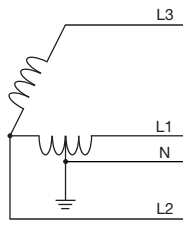

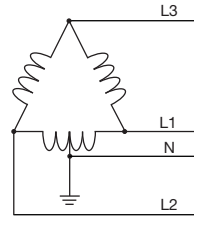

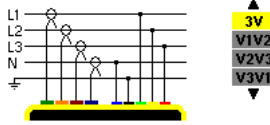

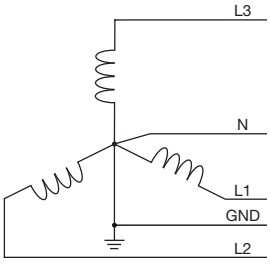

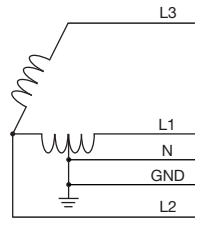

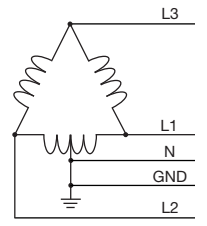

Several electrical diagrams can be selected:
Use the arrow keys (▲,▼, ◄, ►) to choose a connection.

One or more types of network correspond to each distribution system.

Distribution system	Source	
Single-phase 2-wire (L1 and N)	Single-phase 2-wire non-earthed neutral	
Single-phase 3-wire (L1, N and earth)	Single-phase 3-wire earthed neutral	
Split-phase 2-wire (L1 and L2)	Split-phase 2-wire	
	3-phase open star 2-wire	

Distribution system	Source	
Split-phase 3-wire (L1, L2 and N)	Split-phase 3-wire non-earthed neutral	L1 / N / L2
	3-phase open star 3-wire non-earthed neutral	N / L1 / L2
	3-phase high leg delta 3-wire non-earthed neutral	L1 / N / L2
	3-phase open high leg delta 3-wire non-earthed neutral	L1 / N / L2
Split-phase 4-wire (L1, L2, N and earth)	Split-phase 4-wire earthed neutral	L1 / N / GND / L2
	3-phase open star 4-wire earthed neutral	N / L1 / GND / L2
	3-phase high leg delta 4-wire earthed neutral	L1 / N / GND / L2
	3-phase open high leg delta 4-wire earthed neutral	L1 / N / GND / L2

Distribution system	Source	
3-phase 3-wire (L1, L2 and L3) Indicate which current sensors will be connected: all 3 (3A) or only 2 (A1 and A2, or A2 and A3, or A3 and A1). Three-wattmeter method with virtual neutral (with 3 sensors connected) or two-wattmeter method or two-element method or Aron method (with 2 sensors connected). A third sensor is not necessary if two sensors of the same type, same range, and same ratio are connected. Otherwise, the third sensor must be connected to make current measurements.	3-phase star 3-wire	
	3-phase delta 3-wire	
	3-phase open delta 3-wire	
	3-phase open delta 3-wire earthed junction of phases	
	3-phase open delta 3-wire earthed corner of phase	
	3-phase high leg delta 3-wire	
	3-phase open high leg delta 3-wire	

Distribution system	Source	
3-phase 4-wire (L1, L2, L3 and N) Indicate which voltages will be connected: all 3 (3V) or only 2 (V1 and V2, or V2 and V3, or V3 and V1). If only two of the three voltages are connected, the three phase voltages must be balanced (2½-element method)	3-phase star 4-wire non-earthed neutral	
	3-phase open high leg delta 4-wire non-earthed neutral	
	3-phase high leg delta 4-wire non-earthed neutral	
3-phase 5-wire (L1, L2, L3, N and earth) Indicate which voltages will be connected: all 3 (3V) or only 2 (V1 and V2, or V2 and V3, or V3 and V1). If only two of the three voltages are connected, the three phase voltages must be balanced (2½-element method)	3-phase star 5-wire earthed neutral	
	3-phase open high leg delta 5-wire earthed neutral	
	3-phase high leg delta 5-wire earthed neutral	

Then validate with the ↵ key . The device returns to the *Configuration* menu.

This makes it possible to connect the device to all existing networks.

Note: It is impossible to select a new connection if the device is recording, metering energy, or searching for transients, alarms, and/or inrush current acquisitions.

4.7. SENSORS AND RATIOS

Note: The ratios cannot be changed if the device is recording, metering energy, or searching for transients, alarms, and/or inrush current acquisitions.

4.7.1. CURRENT SENSORS AND RATIOS

A first screen **A** is used to define the current sensors and ratios. It automatically displays the current sensor models detected by the device. If a sensor is detected but not managed, an error message is displayed.
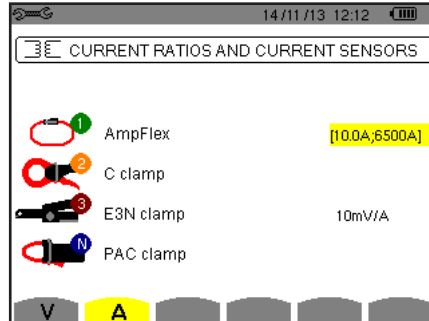

Figure 25: Current clamp and ratios screen in the Sensors and ratios menu

In the case of a 3-wire three-phase set-up where only two of the three current sensors required are connected, if these two sensors are of the same type and have the same ratio, the device simulates the third sensor by assuming the same characteristics as for the two others. The third sensor will be shown in the list as being simulated, or impossible to simulate otherwise.

The various current sensors are:

	MN93 clamp: 200 A.
	MN93A clamp: 100 A or 5 A.
	C193 clamp: 1000 A.
	J93 clamp : 3500 A.
	AmpFLEX™ A193: 100, 6500 or 10000 A.
	MiniFLEX MA193: 100, 6500 or 10000 6500 A.
	PAC93 clamp: 1000 A.
	E3N clamp: 100 A (sensitivity 10 mV/A).
	E3N clamp: 10 A (sensitivity 100 mV/A).
	Three phase adapter: 5 A.

If an *MN93A clamp* (5A range) or an *Adapter* is used, the current ratio setting is proposed automatically.
If an *MN93A clamp* (5A range), an *Adapter*, an *AmpFLEX™*, a *MiniFLEX*, or an *E3N clamp* is used, adjustment of the ratio, of the range, or of the sensitivity is proposed automatically.

Use the arrow keys (▲,▼, ◄, ►) to define the transformation ratios between the primary current (1A to 60,000A) and the secondary current (1A, 2A or 5A), then validate with the ↵ key.

The primary current cannot be less than the secondary current.

4.7.2. VOLTAGE RATIOS

A second screen **V** or **U**, defines the voltage ratios.

The programming of the ratio or ratios can be different or the same for all or for some channels.
The ratios to be programmed are phase-to-neutral voltage ratios when there is a neutral and phase-to-phase voltage ratios when there is not.

To change the ratios, press the ↵ key.
*Figure 26: the Voltage Ratios screen in the Sensors and ratios menu in the case of a set-up **without** neutral*
*Figure 27: the Voltage Ratios screen in the Sensors and ratios menu in the case of a set-up **with** neutral*

Use the arrow keys (▲,▼) to choose the configuration of the ratios.
- 3U 1/1 or 4V 1/1: all channels have the same 1/1 ratio.
- 3U or 4V: all channels have the same ratio, to be programmed.
  - Press the ↵ key, then use the ▲,▼ keys to highlight the ratio in yellow.

  - Press the ↵ key, then use the ▲,▼,◄ and ► keys to change the ratio. The primary voltage is in kV and the secondary voltage is in V.

- 3V + VN: all channels have the same ratio and the neutral has a different ratio.
  Proceed as when there is only one ratio, but perform the operation twice.
- U1+U2+U3 or V1+V2+V3+VN: each channel has a different ratio, to be programmed.
  Proceed as when there is only one ratio, but perform the operation several times.
Validate with the ↵ key. To return to the Configuration menu, press ↰.

Note: the primary and secondary voltages can each be configured with a multiplier factor of $1/\sqrt{3}$.

4.8. CAPTURE MODE

The ⎓ mode is used to configure the voltage thresholds, the current thresholds of the transient mode, and the current thresholds of the inrush current mode.

4.8.1. VOLTAGE THRESHOLDS OF THE TRANSIENT MODE

A ⎓ first screen, displayed by pressing the **V** icon (or **U**, for set-ups without a neutral), is used to configure the voltage thresholds.

The thresholds programmed can be the same for all channels or different for some or all of them.
Figure 28: the Current thresholds screen in the Transient Mode menu

To change the voltage thresholds, press ↵.
Use the arrow keys (▲,▼) to choose configuration of the thresholds.

- 4V or 3U: all channels have the same threshold.
  - Press the ↵ key, then use the ▲,▼ keys to highlight the value of the threshold in yellow.

    ❶ ❷ ❸ Ⓝ   0005V

  - Press the ↵ key, then use the ▲,▼,◄ and ► keys to change the threshold. The unit can be the V or the kV.

    ❶ ❷ ❸ Ⓝ   ▲
                  ◄0005V ►
                   ▼

- 3V + VN: all channels have the same ratio and the neutral has a different ratio.
  Proceed as when there is only one ratio, but perform the operation twice.
- V1+V2+V3+VN or U1+U2+U3: each channel has a different ratio, to be programmed.
  Proceed as when there is only one ratio, but perform the operation several times.

Validate with the ↵ key. To return to the Configuration menu, press ↰.

Note: Changing the thresholds in the transient mode is impossible if the device is searching for transients.

4.8.2. CURRENT THRESHOLDS OF THE TRANSIENT MODE

A second ⟨icon⟩ screen, displayed by pressing the **A** icon, is used to configure the current thresholds (independently of the current sensors detected by the device).

The thresholds programmed can be the same for all channels or different for some or all of them.
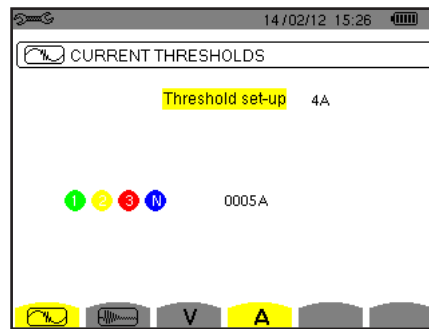

Figure 29: the Voltage thresholds screen in the Transient Mode menu

To change the current thresholds, press ↵.

Use the arrow keys (▲,▼) to choose configuration of the thresholds.
- 4A: all current sensors have the same threshold.
  - Press the ↵ key, then use the ▲,▼ keys to highlight the value of the threshold in yellow.

    ❶ ❷ ❸ Ⓝ   0005A

  - Press the ↵ key, then use the ▲,▼,◄ and ► keys to change the threshold. The unit can be the A, the kA or the mA.

    ❶ ❷ ❸ Ⓝ   ▲
                  ◄0005A ►
                   ▼

- 3A + AN: all current sensors have the same threshold and the one connected to the neutral has a different threshold.
  Proceed as when there is only one ratio, but perform the operation twice.
- A1+A2+A3+AN: each current sensor has a different threshold, to be programmed.
  Proceed as when there is only one ratio, but perform the operation several times.

Validate with the ↵ key. To return to the Configuration menu, press ↰.

Note: Changing the thresholds in the transient mode is impossible if the device is searching for transients.

4.8.3. CURRENT THRESHOLDS OF THE INRUSH CURRENT MODE

A third screen, displayed by pressing the ⊞▥▥▥ icon, is used to define the inrush current thresholds. This involves programming the triggering threshold and the inrush current capture stopping threshold (the stopping threshold being the triggering threshold less the hysteresis).
Figure 30: the Inrush Current Thresholds screen in the Inrush Current Mode menu

To change the inrush current triggering threshold, press the ↵ key.
Use the ▲,▼,◄ and ► keys to change the triggering threshold. The unit can be the A, the kA, or the mA.
Press the ↵ key, then use the ▲,▼ keys to highlight the hysteresis in yellow.
Use the ▲,▼,◄ and ► keys to change the hysteresis and press the ↵ key to validate.

Notes: for more information on the hysteresis, refer to §16.3. Configuring the hysteresis at 100% is equivalent to not having a stop threshold (see §16.7).

Changing the thresholds in inrush current mode is impossible if the device is in inrush current capture.

To return to the *Configuration* menu, press ⤺.

4.9. TREND MODE

The device has a recording function (⌇⌇ key, see §9), used to record measured and calculated values (Urms, Vrms, Arms, etc.).

Press the key of the ⚙ *Configuration* mode and select the ⤳ *Trend Mode* sub-menu.
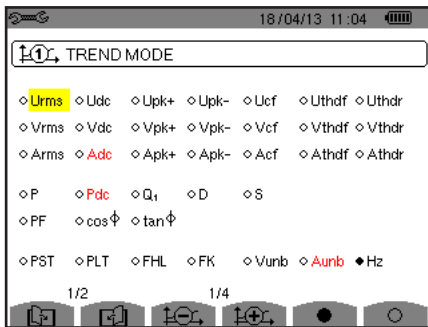

Figure 31: The first screen of the Trend mode
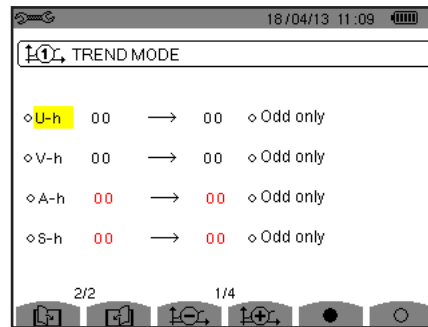

Figure 32: The second screen of the Trend mode

There are 4 possible programmable configurations ⊞①, ⊞②, ⊞③, and ⊞④ independent of one another. To go from one to the other, use the ⊞⊖ or ⊞⊕ key.

To select the parameter to be recorded, move the yellow cursor to this parameter using the ▲,▼,◄ and ► keys then validate with the ↵ key. The selected parameter is identified by a red spot. The frequency (Hz) is always selected (black spot).

Note: If a quantity is displayed in red, it means that it is incompatible with the configuration chosen (connection selected, sensors connected, ratios programmed, reference of the level of harmonics of the phases, breakdown of the non-active quantities). For example, if no current sensor is connected, all current quantities will be in red.

To select all of the parameters of a page, press the ● key.
To unselect all of the parameters of a page, press the ○ key.

To change configuration pages, press the ⬅ or ➡ key.

The recordable values are:

Unit	Designation
Urms	RMS phase-to-phase voltage.
Udc	RMS phase-to-neutral voltage.
Upk+	Maximum peak value of phase-to-phase voltage.
Upk-	Minimum peak value of phase-to-phase voltage.
Ucf	Crest (peak) factor of phase-to-phase voltage.
Uthdf	Harmonic distortion of the phase-to-phase voltage with the RMS value of the fundamental as reference.
Uthdr	Harmonic distortion of the phase-to-phase voltage with the total RMS value without DC as reference.
Vrms	RMS phase-to-neutral voltage.
Vdc	DC phase-to-neutral voltage.
Vpk+	Maximum peak value of the phase-to-neutral voltage.
Vpk-	Minimum peak value of the phase-to-neutral voltage.
Vcf	Crest factor of phase-to-neutral voltage.
Vthdf	Harmonic distortion of the phase-to-neutral voltage with the RMS value of the fundamental as reference.
Vthdr	Harmonic distortion of the phase-to-neutral voltage with the total RMS value without DC as reference.
Arms	RMS current.
Adc	DC current.
Apk+	Maximum peak value of the current.
Apk-	Minimum peak value of the current.
Acf	Crest factor of current.
Athdf	Harmonic distortion of the current with the RMS value of the fundamental as reference.
Athdr	Harmonic distortion of the current with the total RMS value without DC as reference.
P	Active power.
Pdc	DC power.
Q_1	Reactive power (fundamental).
N	Non-active power.
D	Distortion power.
S	Apparent power.
PF	Power factor.
cos Φ	Cosine of the phase shift of the voltage with respect to the current (displacement factor or fundamental power factor – DPF).
tan Φ	Tangent of the phase shift of the voltage with respect to the current.
PST	Short-term flicker.
PLT	Long-term flicker.
FHL	Harmonic loss factor
FK	K factor.
Vunb or Uunb	Negative-sequence phase-to-ground voltage unbalance factor (set-up with neutral). Negative-sequence phase-to-phase voltage unbalance factor (set-up without neutral).
Aunb	Negative-sequence current unbalance factor.
Hz	Network frequency.
U-h	Harmonics in phase-to-phase voltage.
V-h	Harmonics in phase-to-neutral voltage
A-h	Harmonics in current.
S-h	Harmonics in power.

The four last lines involve the recording of the harmonics of U, V, A and S. You can select a range of orders of the harmonics to be recorded (between 0 and 50) for each of these quantities, and within this range, if desired, only odd harmonics.

Note: The level of harmonics of order 01 will be displayed only if they concern values expressed in % r.

To change an order of harmonic, first select the parameter to be recorded (identified by a red spot), then move the yellow cursor to this figure using the ▲,▼,◄ and ► keys, then validate with the ↵ key. Change the value using the ▲ and▼ keys, then validate with the ↵ key.
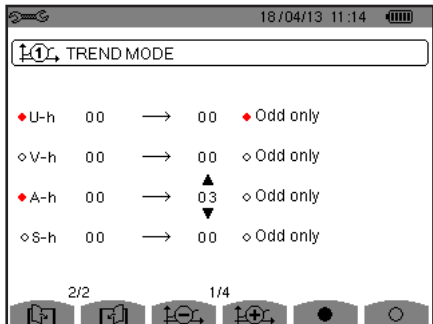

Figure 33: The second screen of the Trend Mode during modification

Note: If a recording is in progress, the associated configuration cannot be modified and the selected values are identified by black spots.

To return to the Configuration menu, press ⤺.

4.10. MODE ALARM MODE

The ⌂ screen defines the alarms used by the *Alarm Mode* function (see §7).

You can define a alarm on each of the following parameters:
Hz, Urms, Vrms, Arms, |Udc|, |Vdc|, |Adc|, |Upk+|, |Vpk+|, |Apk+|, |Upk-|, |Vpk-|, |Apk-|, Ucf, Vcf, Acf, Uthdf, Vthdf, Athdf, Uthdr, Vthdr, Athdr, |P|, |Pdc|, |Q$_1$| or N, D, S, |PF|, |cos Φ|, |tan Φ|, PST, PLT, FHL, FK, Vunb (or Uunb for a three-phase source without neutral), Aunb, U-h, V-h, A-h and |S-h| (see the table of abbreviations in §2.9).

There are 40 programmable alarms.

To activate an alarm, move the yellow cursor to its number using the ▲,▼ keys, then validate with the ↵ key. The active alarm is identified by a red spot. An alarm that is not programmed ("?") cannot be activated.

To program the alarm, move the yellow cursor using the ▲,▼,◄ and ► keys, then validate with the ↵ key. Change the value, then validate again.
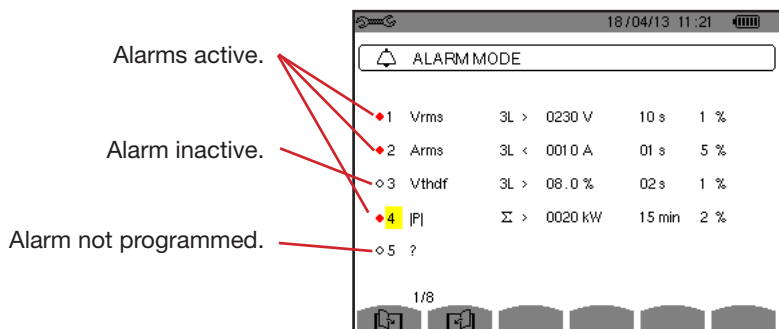

Figure 34: The Alarm mode menu

33

- The type of alarm.
- The order of the harmonic (between 0 and 50), for |S-h|, A-h, U-h and V-h only.
- The target of the alarm:
  - 3L: 3 phases monitored individually,
  - N: monitoring of neutral,
  - 4L: 3 phases and neutral monitored individually,
  - Σ: surveillance of the value of the complete system.
- The direction of the alarm (>or <) in the case of Hz, Urms, Vrms, Arms, |Udc|, |Vdc|, |Adc|, |Upk+|, |Vpk+|, |Apk+|, |Upk-|, |Vpk-| and |Apk-|.
- The triggering threshold of the alarm (value and unit for Urms, Vrms, Arms, |Udc|, |Vdc|, |Adc|, |Upk+|, |Vpk+|, |Apk+|, |Upk-|, |Vpk-|, |Apk-|, |P|, |Pdc|, |Q_1| or N, D and S).
- The triggering delay, or minimum duration above or below the alarm threshold: in minutes or seconds or, in the case of Vrms, Urms and Arms (excluding the neutral), in hundredths of a second.
- The hysteresis: 1%, 2%, 5% or 10% (see §16.3).

To go from one page to the other, press the ⬚ or ⬚ key.

Each overshoot of an alarm will be recorded in a campaign of alarms.

Notes: The display in red of an alarm line means that the programmed quantity and/or target is incompatible with the configuration chosen (connection selected, sensors connected, ratios programmed, calculation methods chosen).

The alarms on the level of harmonics of order 01 concern only the values expressed in % r.

If a search for alarms is in progress, the activated alarms cannot be modified and are identified by black spots. However, new alarms (not yet programmed or not activated) can be activated.

To return to the Configuration menu, press ⬑.

4.11. ERASE MEMORY

The ⬚ menu partially or totally deletes the data recorded in the device.
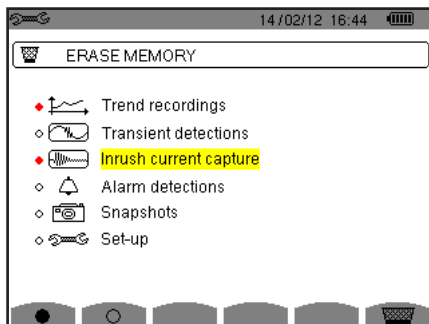

Figure 35: Erase memory menu

To select an item to be erased, move the yellow cursor to it using the ▲,▼,◀ and ▶ keys, then validate with the ↵ key. The item to be erased is identified by a red spot.

To select all items, press ⬤.
To unselect all items, press ○.

To proceed with the erasure, press the ⬚ key , then confirm with the ↵ key.

To return to the Configuration menu, press ⬑.

Note: Which erasures are possible depends on the recordings in progress (recording, metering of energy, search for transients, alarms, and/or inrush current acquisition).

4.12. ABOUT

The ⓘ About screen displays information concerning the device.
Figure 36: the About menu

To return to the Configuration menu, press ⤺.

5.

6.3.2. THE L1 APPARENT POWER HARMONICS DISPLAY SCREEN

This information concerns the harmonic pointed to by the cursor.
S-h03: harmonic number.
%: level of harmonics with the fundamental apparent power as reference (%f) or the (total) apparent power as reference (%r).
+045°: phase shift of the voltage harmonic with respect to the current harmonic for the order in question.
min–max: maximum and minimum levels of the harmonic in question. They are reset when the harmonic number is changed or the ↵ key is pressed.
Harmonic selection cursor. Use the ◀ or ▶ key to move the cursor.

Display of the 3 phases 3L, of L1, L2 or L3. To select the display press the ▲ or ▼.

The horizontal axis indicates the orders of the harmonics. The level of the harmonic is given as a percentage of the fundamental apparent power or the (total) apparent power.
Rang DC: DC component.
1 to 25: harmonics of order 1 to 25. When the cursor exceeds order 25, order 26 to 50 appears.
⊗➝◻ Indicator of energy consumed for this harmonic.

Figure 57: example of L1 apparent power of harmonics display

Note: Filters L2 and L3 display the apparent power of the harmonics for phases 2 and 3, respectively. The screen is identical to the one displayed for filter L1.

6.4. PHASE-TO-PHASE VOLTAGE

The **U** sub-menu is available for all connections except 2- or 3-wire single-phase.. This sub-menu displays the harmonics of the phase-to-phase voltage.

6.4.1. THE 3L PHASE-TO-PHASE VOLTAGE HARMONICS DISPLAY SCREEN

This information concerns the harmonic pointed to by the cursor.
U-h03: harmonic number.
%: level of harmonics with the fundamental RMS value as reference (%f) or the (total) RMS value as reference (%r).
V: RMS voltage of the harmonic in question.
+000°: phase shift with respect to the fundamental (order 1).
Harmonic selection cursor. Use the ◀ or ▶ key to move the cursor.

Display of the 3 phases 3L, of L1, L2, L3. To select the display press ▲ or ▼.

The horizontal axis indicates the orders of the harmonics. The level of the harmonic is given as a percentage with respect to the fundamental or to the total RMS value.
Rang DC: DC component.
1 to 25: harmonics of order 1 to 25. When the cursor exceeds order 25, order 26 to 50 appears.

Figure 58: example of 3L phase-to-phase voltage harmonics display

6.4.2. THE L1 PHASE-TO-PHASE VOLTAGE HARMONICS DISPLAY SCREEN

This information concerns the harmonic pointed to by the cursor.
Uh 03: harmonic number.
%: level of harmonics with the fundamental RMS value as reference (%f) or the (total) RMS value as reference (%r).
V: RMS voltage of the harmonic in question.
+000°: phase shift with respect to the fundamental (order 1).
max – min: indicators of the maximum and minimum of the level of harmonics or by pressing the ↵ key.
THD: total harmonic distortion.
Ud: phase-to-phase RMS distortion voltage.

Display of the 3 phases 3L, of L1, L2 or L3. To select the display press ▲ or ▼.

The horizontal axis indicates the orders of the harmonics. The level of the harmonic is given as a percentage with respect to the fundamental or to the total RMS value.
Rang DC: DC component.
1 to 25: harmonics of order 1 to 25. When the cursor exceeds order 25, order 26 to 50 appears.

Harmonic selection cursor. Use the ◀ or ▶ key to move the cursor.

Figure 59: example of L1 phase-to-phase voltage harmonics display

Note: Filters L2 and L3 display the phase-to-phase voltage harmonics for phases 2 and 3, respectively. The screen is identical to the one displayed for filter L1.

6.5. EXPERT MODE

The ⊡ Expert mode is available with a three-phase connection only. It is used to display the influence of the harmonics on the heating of the neutral and on rotating machines. To display expert mode press the ▲ or ▼ key of the keypad. The selection is highlighted in yellow and the screen simultaneously displays the expert mode.

From this screen, two sub-menus are available:
■ **V** for three-phase set-ups with neutral or **U** for the three-phase set-up without neutral.
■ **A** for the expert mode in current.

Note : The breakdown into sequences shown here is valid only in the case of a balanced load.

6.5.1. THE PHASE-TO-NEUTRAL VOLTAGE EXPERT MODE DISPLAY SCREEN

For three-phase set-ups with neutral, the **V** sub-menu displays the

influence of the harmonics of the phase-to-neutral voltage on the
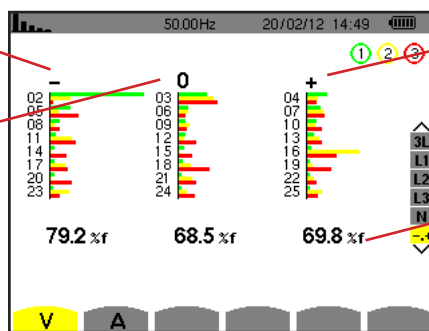

heating of the neutral and on rotating machines.

Harmonics inducing a negative sequence.
Harmonics inducing a zero sequence.

Harmonics inducing a positive sequence.
%: level of harmonics with the fundamental RMS value as reference (%f) or the (total) RMS value as reference (%r).

Figure 60: The phase-to-neutral voltage expert mode screen (three-phase set-ups with neutral)

For three-phase set-ups without neutral, the **U** sub-menu displays the influence of the harmonics of the phase-to-phase voltage on the heating of revolving machines.

6.5.2. THE CURRENT EXPERT MODE DISPLAY SCREEN

The **A** sub-menu displays the influence of the harmonics of the current on the heating of the neutral and on rotating machines.

Harmonics inducing a negative sequence.

Harmonics inducing a zero sequence.

Harmonics inducing a positive sequence.

%: level of harmonics with the fundamental RMS value as reference (%f) or the (total) RMS value as reference (%r).
Figure 61: the current expert mode screen

7. WAVEFORM

The ⌇ *Waveform* key is used to display the current and voltage curves, along with the values measured and those calculated from the voltages and currents (except for power, energy, and harmonics).
This is the screen that appears when the device is powered up.

Display of the maximum and minimum RMS values and of the peak values (see §7.4).

Measurement of the peak factor (see §7.3).

Measurement of total harmonic distortion (see §7.2).

Measurement of the true RMS value (see §7.1).
Selection of the display filters. Use the ▲ or ▼ key to select the display.

Simultaneous display of the following measurements: RMS, DC, THD, CF, PST, PLT, FHL and FK (see §7.5)

Display of the Fresnel diagram of the signals (see §7.6).

Figure 62: Waveform mode screen

7.1. MEASUREMENT OF TRUE RMS VALUE

The **RMS** sub-menu displays the waveforms over one period of the signals measured and the true RMS voltage and current.

The choice of curves to be displayed depends on the type of connection (see §4.6):

- Single-phase, 2-wire or Split-phase, 2-wire: no choice (L1)
- Single-phase, 3-wire:
  - For **RMS**, **THD**, **CF**, ⊥ and ▥: 2V, 2A, L1, N
  - For ∡⊘: no choice (L1)
- Split-phase, 3-wire:
  - For **RMS**, **THD**, **CF**, ⊥ and ▥: U, 2V, 2A, L1, L2
  - For ∡⊘: 2V, 2A, L1, L2
- Split-phase, 4-wire:
  - For **RMS**, **THD**, **CF**, ⊥ and ▥: U, 3V, 3A, L1, L2 N
  - For ∡⊘: 2V, 2A, L1, L2
- Three-phase, 3wire: 3U, 3A
- Three-phase, 4-wire: 3U, 3V, 3A, L1, L2, L3
- Three-phase, 5-wire:
  - For **RMS**, **THD**, **CF**, ⊥ and ▥: 3U, 4V, 4A, L1, L2, L3 and N
  - For: ∡⊘ 3U, 3V, 3A, L1, L2 and L3

The screen snapshots shown as examples are those obtained with a three-phase 5-wire connection.

7.1.1. THE 3U RMS DISPLAY SCREEN

This screen displays the three phase-to-neutral voltages of a three-phase system.
RMS phase-to-phase voltages.

Voltage axis with automatic scaling.

Instantaneous value cursor. Use the ◀ or ▶ key to move the cursor.

Instantaneous values of the signals at the position of the cursor.
t: time relative to the start of the period.
U1: instantaneous phase-to-phase voltage between phases 1 and 2 (U_{12}).
U2: instantaneous phase-to-phase voltage between phases 2 and 3 (U_{23}).
U3: instantaneous phase-to-phase voltage between phases 3 and 1 (U_{31}).

Figure 63: The 3U RMS display screen

7.1.2. THE 4V RMS DISPLAY SCREEN

This screen displays the three phase-to-neutral voltages and the neutral-to-earth voltage of a three-phase system.
RMS voltages.

Voltage axis with automatic scaling.

Instantaneous value cursor. Use the ◀ or ▶ key to move the cursor.

Instantaneous values of the signals at the position of the cursor.
t: time relative to the start of the period.
V1: instantaneous phase-to-neutral voltage of curve 1.
V2: instantaneous phase-to-neutral voltage of curve 2.
V3: instantaneous phase-to-neutral voltage of curve 3.
VN: instantaneous value of the neutral voltage.

Figure 64: The 4V RMS display screen

7.1.3. THE 4A RMS DISPLAY SCREEN

This screen displays the three phase currents and the neutral current of a three-phase system.
RMS currents.

Current axis with automatic scaling.

Instantaneous value cursor. Use the ◀ or ▶ key to move the cursor.

Instantaneous values of the signals at the intersection of the cursor and of the curves.
t: time relative to the start of the period.
A1: instantaneous current of phase 1.
A2: instantaneous current of phase 2.
A3: instantaneous current of phase 3.
AN: instantaneous value of the neutral current.

Figure 65: The 4A RMS display screen

51

7.1.4. THE RMS DISPLAY SCREEN FOR THE NEUTRAL

This screen displays the neutral voltage with respect to earth and the neutral current.

RMS voltage and current.

Current and voltage axis with automatic scaling.

Instantaneous value cursor. Use the ◀ or ▶ key to move the cursor.

Instantaneous values of the signals at the position of the cursor.
t: time relative to the start of the period.
VN: instantaneous neutral voltage.
AN: instantaneous neutral current.
Figure 66: The RMS display screen for the neutral

Note: Filters L1, L2, and L3 display the current and voltage in phases 1, 2, and 3, respectively. The screen is identical to the one displayed for the neutral.

7.2. MEASUREMENT OF TOTAL HARMONIC DISTORTION

The **THD** sub-menu displays the waveforms of the signals measured over one full cycle and the total voltage and current harmonic distortion. The levels are displayed either with the fundamental RMS value as reference (%f) or with the RMS value without DC as reference (%r), depending on which reference is chosen in the configuration menu.

7.2.1. THE 3U THD DISPLAY SCREEN

This screen displays the phase-to-phase voltage waveforms for one period and the total harmonic distortion values.

Harmonic distortion for each curve.

Voltage axis with automatic scaling.

Instantaneous value cursor. Use the ◀ or ▶ key to move the cursor.

Instantaneous values of the signals at the position of the cursor.
t: time relative to the start of the period.
U1: instantaneous phase-to-phase voltage between phases 1 and 2 (U_{12}).
U2: instantaneous phase-to-phase voltage between phases 2 and 3 (U_{23}).
U3: instantaneous phase-to-phase voltage between phases 3 and 1 (U_{31}).
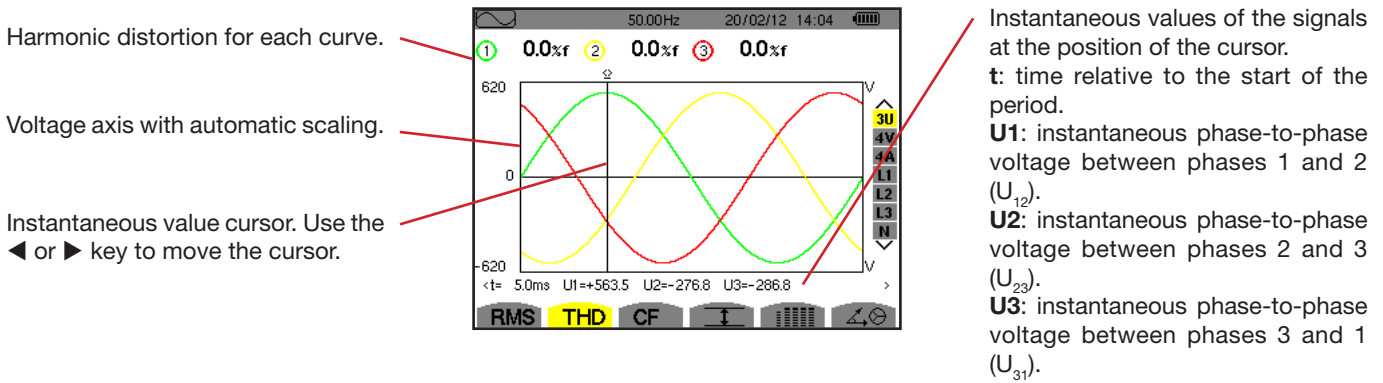

Figure 67: The 3U THD display screen en 3U

7.2.2. THE 4V THD DISPLAY SCREEN

This screen displays the phase-to-neutral voltage waveforms for one period and the total harmonic distortion values.

Harmonic distortion for each curve.

Voltage axis with automatic scaling.

Instantaneous value cursor. Use the ◀ or ▶ key to move the cursor.

Instantaneous values of the signals at the position of the cursor.
t: time relative to the start of the period.
V1: instantaneous phase-to-neutral voltage of curve 1.
V2: instantaneous phase-to-neutral voltage of curve 2.
V3: instantaneous phase-to-neutral voltage of curve 3.
VN: instantaneous value of the neutral voltage.
Figure 68: the 4V THD display screen

52

7.2.3. THE 4A THD DISPLAY SCREEN

This screen displays the phase current waveforms for one period and the total harmonic distortion values.

Harmonic distortion for each curve.

Current axis with automatic scaling.

Instantaneous value cursor. Use the ◄ or ► key to move the cursor.
Instantaneous values of the signals at the position of the cursor.
t: time relative to the start of the period.
A1: instantaneous current of phase 1.
A2: instantaneous current of phase 2.
A3: instantaneous current of phase 3.
AN: instantaneous value of the neutral current.

Figure 69: The 4A THD display screen

Note: Filters L1, L2, L3 and N display the total current and voltage harmonic distortion for phases 1, 2 and 3 and the neutral channel.

7.3. MEASUREMENT OF THE PEAK FACTOR

The **CF** sub-menu displays the waveforms of the signals measured over one period and the voltage and current peak factors.

7.3.1. THE 3U CF DISPLAY SCREEN

This screen displays the phase-to-phase voltage waveforms of one period and the peak factors.

Peak factor for each curve.

Voltage axis with automatic scaling.

Instantaneous value cursor. Use the ◄ or ► key to move the cursor.
Instantaneous values of the signals at the position of the cursor.
t: time relative to the start of the period.
U1: instantaneous phase-to-phase voltage between phases 1 and 2 (U_{12}).
U2: instantaneous phase-to-phase voltage between phases 2 and 3 (U_{23}).
U3: instantaneous phase-to-phase voltage between phases 3 and 1 (U_{31}).

Figure 70: The 3U CF display screen

7.3.2. THE 4V CF DISPLAY SCREEN

This screen displays the phase-to-neutral voltage waveforms of one period and the peak factors.

Peak factor for each curve.

Voltage axis with automatic scaling.

Instantaneous value cursor. Use the ◄ or ► key to move the cursor.
Instantaneous values of the signals at the position of the cursor.
t: time relative to the start of the period.
V1: instantaneous phase-to-neutral voltage of curve 1.
V2: instantaneous phase-to-neutral voltage of curve 2.
V3: instantaneous phase-to-neutral voltage of curve 3.
VN: instantaneous value of the phase-to-neutral voltage of the neutral.

Figure 71: The 3V CF display screen

7.3.3. THE 4A CF DISPLAY SCREEN

This screen displays the current waveforms of one period and the peak factors.

Peak factor for each curve.

Current axis with automatic scaling.

Instantaneous value cursor. Use the ◀ or ▶ key to move the cursor.

Instantaneous values of the signals at the position of the cursor.
t: time relative to the start of the period.
A1: instantaneous current of phase 1.
A2: instantaneous current of phase 2.
A3: instantaneous current of phase 3.
AN: instantaneous value of the current of the neutral.

Figure 72: The 4A CF display screen

Note: L1, L2, L3 and N display the current and voltage peak factors for phases 1, 2 and 3, respectively and the neutral channel.

7.4. MEASUREMENT OF EXTREME AND MEAN VOLTAGE AND CURRENT

The ⊥ sub-menu displays the one-second mean and half-cycle maximum and minimum RMS voltage and current and the instantaneous positive and negative peak voltage and current.

Note: The MAX. and MIN. RMS measurements are calculated every half cycle (i.e. every 10 ms for a 50-Hz signal). The measurements are refreshed every 250 ms.

The RMS measurements are calculated over one second.

7.4.1. THE 3U MAX.-MIN. DISPLAY SCREEN

This screen displays the one-second mean and half-cycle maximum and minimum RMS values and the positive and negative phase-to-phase voltage peaks.

Columns of values for each curve (1, 2, and 3).
MAX: maximum RMS phase-to-phase voltage since the switching on of the device or since the last time the ↵ key was pressed.
RMS: true RMS phase-to-phase voltage.
MIN: minimum RMS phase-to-phase voltage since the switching on of the device or since the last time the ↵ key was pressed.
PK+: maximum (positive) peak phase-to-phase voltage since the switching on of the device or since the last time the ↵ key was pressed.
PK-: minimum (negative) peak phase-to-phase voltage since the switching on of the device or since the last time the ↵ key was pressed.

Figure 73: The 3U Max.-Min. display screen

7.4.2. THE 4V MAX.-MIN. DISPLAY SCREEN

This screen displays the one-second mean and half-cycle maximum and minimum RMS values and the positive and negative peaks of the phase-to-neutral voltages and of the neutral.
Column of values for the neutral: RMS, PEAK+ and PEAK- parameters.

Columns of values for each voltage curve (1, 2 and 3).
MAX: maximum RMS phase-to-neutral voltage since the switching on of the device or since the last time the ↵key was pressed.
RMS: true RMS phase-to-neutral voltage.
MIN: minimum RMS phase-to-neutral voltage since the switching on of the device or since the last time the ↵key was pressed.
PK+: maximum peak phase-to-neutral voltage since the switching on of the device or since the last time the ↵key was pressed.
PK-: minimum peak phase-to-neutral voltage since the switching on of the device or since the last time the ↵key was pressed.

Figure 74: The 4V Max.-Min. display screen

7.4.3. THE 4A MAX.-MIN. DISPLAY SCREEN

This screen displays the one-second mean and half-cycle maximum and minimum RMS values and the positive and negative peak values of the phase and neutral currents.
Column of values for the neutral: RMS, PEAK+ and PEAK- parameters.

Columns of values for each current curve (1, 2 and 3).
MAX: maximum RMS current since the switching on of the device or since the last time the ↵key was pressed.
RMS: true RMS current.
MIN: minimum RMS current since the switching on of the device or since the last time the ↵key was pressed.
PK+: maximum peak current since the switching on of the device or since the last time the ↵key was pressed.
PK-: minimum peak current since the switching on of the device or since the last time the ↵key was pressed.

Figure 75: The 4A Max.-Min. display screen

7.4.4. THE L1 MAX.-MIN. DISPLAY SCREEN

This screen displays the one-second mean and half-cycle maximum and minimum RMS values and the positive and negative peaks of the phase-to-neutral voltage and of the current of phase 1.
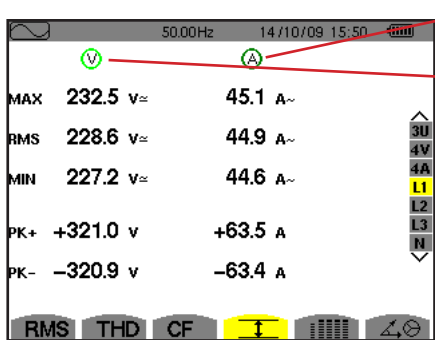

The same information as for the phase-to-neutral voltage, but for the current.

Column of voltage values.
MAX: maximum RMS phase-to-neutral voltage since the switching on of the device or since the last time the ↵key was pressed.
RMS: true RMS phase-to-neutral voltage.
MIN: minimum RMS phase-to-neutral voltage since the switching on of the device or since the last time the ↵key was pressed.
PK+: phase-to-neutral maximum peak voltage since the switching on of the device or since the last time the ↵key was pressed.
PK-: phase-to-neutral minimum peak voltage since the switching on of the device or since the last time the ↵key was pressed.

Figure 76: The L1 Max.-Min. display screen

Note: L2 and L3 display the RMS, maximum, minimum, and mean values and the positive and negative peak values of the phase-to-neutral voltage and of the current for phases 2 and 3, respectively.

7.4.5. THE NEUTRAL MAX.-MIN. DISPLAY SCREEN

This screen displays the RMS values and the positive and negative peaks of the neutral relative to earth.

Column of voltage values.
RMS: true RMS voltage.
PK+: maximum peak voltage since the switching on of the device or since the last time the ↵key was pressed.
PK-: minimum peak voltage since the switching on of the device or since the last time the ↵key was pressed.
The same information as for the voltage, but for the current.

Figure 77: The neutral Max.-Min. display screen

7.5. SIMULTANEOUS DISPLAY

The ▥ sub-menu displays all of the voltage and current measurements (RMS, DC, THD, CF, PST, PLT, FHL and FK).

7.5.1. 3U SIMULTANEOUS DISPLAY SCREEN

This screen displays the RMS, DC, THD, and CF values of the phase-to-phase voltages.

Column of phase-to-phase voltages (phases 1, 2, and 3).
RMS: true RMS value calculated over 1 second.
DC: DC component.
THD: total harmonic distortion with the fundamental RMS value as reference (%f) or with the total RMS value without DC as reference (%r).
CF: peak factor calculated over 1 second.
Figure 78: 3U simultaneous display screen

7.5.2. 4V SIMULTANEOUS DISPLAY SCREEN

This screen displays the RMS, DC, THD, CF, PST and PLT values of the phase-to-neutral voltages and of the neutral.

Column of RMS and DC values along with the CF and the THD (%r) concerning the neutral.

Column of voltages simple (phases 1, 2, and 3).
RMS: true RMS value calculated over 1 second.
DC: DC component.
THD: total harmonic distortion with the fundamental RMS value as reference (%f) or with the total RMS value without DC as reference (%r).
CF: peak factor calculated over 1 second.
PST: short-term flicker calculated over 10 minutes.
PLT: long-term flicker calculated over 2 hours.
Figure 79: 4V simultaneous display screen

7.5.3. 4A SIMULTANEOUS DISPLAY SCREEN

This screen displays the RMS, DC (only if at least one of the current sensors can measure direct current), THD, CF, FHL and FK values of the phase and neutral currents.

Column of RMS values and (if the current sensor allows) DC values along with the CF and the THD (%r) concerning the neutral.

Columns of current values (phases 1, 2 and 3).
RMS: true RMS value calculated over 1 second.
DC: DC component.
THD: total harmonic distortion with the fundamental RMS value as reference (%f) or with the total RMS value without DC as reference (%r).
CF: peak factor calculated over 1 second.
FHL: harmonic loss factor. For the oversizing of transformers to allow for harmonics.
FK: K factor. Derating of the transformer as a function of the harmonics.
Figure 80: 4A simultaneous display screen

Note: To make it possible to adjust the zero of current sensors measuring DC, the DC values are never cancelled.

7.5.4. L1 SIMULTANEOUS DISPLAY SCREEN

This screen displays the RMS, DC, THD, and CF values of the phase-to-neutral voltage and of the current, PST and PLT of the phase-to-neutral voltage, and FHL and FK of the current for phase 1.

Column of voltage values simple.
RMS: true RMS value calculated over 1 second.
DC: DC component.
THD: total harmonic distortion with the fundamental RMS value as reference (%f) or with the total RMS value without DC as reference (%r).
CF: peak factor calculated over 1 second.
PST: short-term flicker calculated over 10 minutes.
PLT: long-term flicker calculated over 2 hours.
Current column.
RMS, DC (if the current sensor allows), THD and CF values.
FHL: harmonic loss factor. For the oversizing of transformers to allow for harmonics.
FK: K factor. Derating of the transformer as a function of the harmonics.

Figure 81: L1 simultaneous Display screen

Notes: The DC value of the current of phase 1 is displayed only if the associated current sensor can measure direct current.

L2 and L3 provide the simultaneous display of the current and voltage for phases 2 and 3, respectively.

7.5.5. SCREEN FOR SIMULTANEOUS DISPLAY OF NEUTRAL

This screen displays the RMS, THD and CF voltage and current of the neutral, the DC component of the neutral voltage, and (if the current sensor allows) the DC component of the neutral current.

7.6. DISPLAY OF FRESNEL DIAGRAM

The ∡⊖ sub-menu displays a vector representation of the fundamentals of the voltages and currents. It indicates their associated quantities (modulus and phase of the vectors) and the negative-sequence voltage and current unbalance rates.

Note: To allow the display of all vectors, those of which the modulus is too small to be pictured are shown even so, but their name is followed by an asterisk (*).

7.6.1. THE 3V FRESNEL DIAGRAM DISPLAY SCREEN

This screen displays a vector representation of the fundamentals of the phase-to-neutral voltages and of the currents. It indicates their associated quantities (modulus and phase of the phase-to-neutral voltage vectors) and the negative-sequence voltage unbalance rate. The reference vector of the representation (at 3 o'clock) is V1.

Column of values for each vector (1, 2, and 3).
|V1|, |V2| and |V3|: module of the vectors of the fundamentals of the phase-to-neutral voltages (phases 1, 2 and 3).
Φ_{12}: phase angle of the fundamental of phase 1 with respect to the fundamental of phase 2.
Φ_{23}: phase angle of the fundamental of phase 2 with respect to the fundamental of phase 3.
Φ_{31}: phase angle of the fundamental of phase 3 with respect to the fundamental of phase 1.

Discs indicating potential saturation of the channel.

Fresnel diagram.

Vunb: negative-sequence voltage unbalance rate.
Figure 82: The screen Displaying the Fresnel diagram in 3V

7.6.2. THE 3U FRESNEL DIAGRAM DISPLAY SCREEN

This screen displays a vector representation of the fundamentals of the phase-to-phase voltages and of the currents. It indicates their associated quantities (modulus and phase of the phase-to-phase voltage vectors) and the negative-sequence voltage unbalance rate. The reference vector of the representation (at 3 o'clock) is U1.

The information displayed is identical to that described in §7.6.1 but relative to the phase-to-phase voltage.

7.6.3. THE 3A FRESNEL DIAGRAM DISPLAY SCREEN

For sources having a neutral, this screen displays the vector representation of the fundamental component of the phase-to-neutral voltages and of the current. For 3-wire three-phase (source without neutral), this screen displays only the vector representation of the fundamental components of the current. It indicates their associated quantities (modulus and phase of the current vectors) and negative-sequence current unbalance rate. The reference vector of the representation (at 3 o'clock) is A1.

The information displayed is identical to that described in §7.6.1 but relative to the current.

7.6.4. THE L1 FRESNEL DIAGRAM DISPLAY SCREEN

In the presence of the neutral, this screen displays a vector representation of the fundamentals of the phase-to-neutral voltages and the currents of one phase. It indicates their associated quantities (modulus and phase of the current and phase-to-neutral voltage vectors). The reference vector of the representation (at 3 o'clock) is the current vector.

|V1|: modulus of the vector of the fundamental of the phase-to-neutral voltage of phase 1.
|A1|: modulus of the vector of the fundamental of the current of phase 1.

Φ_{VA}: phase angle of the fundamental of the phase-to-neutral voltage of phase 1 relative to the fundamental of the current of phase 1.

Discs indicating potential saturation of the channel.
Figure 83: The L1 Fresnel diagram display screen

Note: L2 and L3 display vector representations of the fundamentals of the phase-to-neutral voltages and the currents of phases 2 and 3, respectively. They indicate their associated quantities (modulus and phase of the current and phase-to-neutral voltage vectors of phases 2 and 3, respectively). The reference vector of the representation (at 3 o'clock) is the current vector (A2 and A3, respectively).

In the absence of the neutral (2-wire two-phase):

|U1|: modulus of the vector of the fundamental component of the phase-to-phase voltage between phases 1 and 2 (U_{12}).
|A1|: modulus of the vector of the fundamental of the current of phase 1.

Φ_{UA}: phase shift of the fundamental component of the phase-to-phase voltage between phases 1 and 2 (U_{12}) with respect to the fundamental component of the current of phase 1.

Discs indicating potential saturation of the channel.
Figure 84: the Fresnel diagram display screen in 2-wire two-phase

8. ALARM MODE

The 🔔 *Alarm* mode detects overshoots of thresholds on each of the following parameters:
Hz, Urms, Vrms, Arms, |Udc|, |Vdc|, |Adc|, |Upk+|, |Vpk+|, |Apk+|, |Upk-|, |Vpk-|, |Apk-|, Ucf, Vcf, Acf, Uthdf, Vthdf, Athdf, Uthdr, Vthdr, Athdr, |P|, |Pdc|, |Q_1| or N, D, S, |PF|, |cos Φ|, |tan Φ|, PST, PLT, FHL, FK, Vunb, Uunb (for a three-phase source without neutral) Aunb, U-h, V-h, A-h and |S-h| (see the table of abbreviations in §2.9).

The alarm thresholds:
■ must have been programmed in the *Configuration / Alarm mode* screen (see §4.10).
■ must be active (marked with a red spot on that same screen).

Stored alarms can subsequently be transferred to a PC via the PAT application (see §13). You can capture over 16,000 alarms.
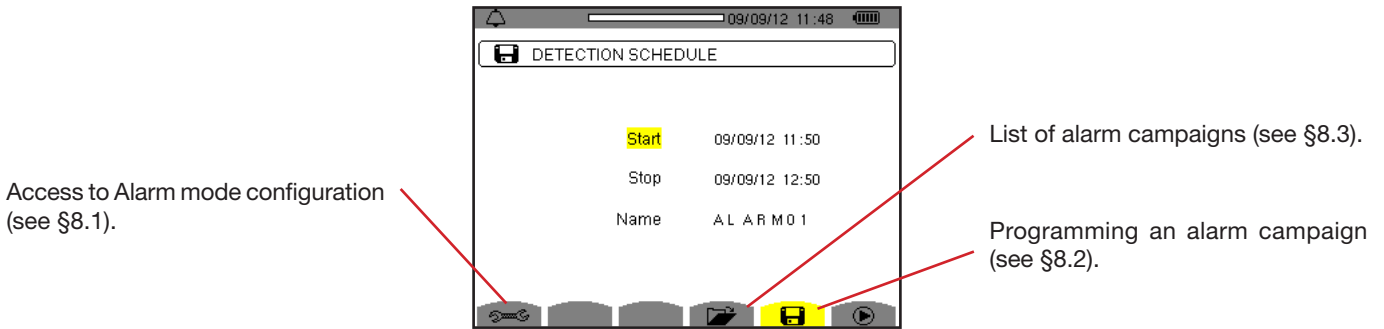

Figure 85: The Alarm Mode screen

List of alarm campaigns (see §8.3).

Programming an alarm campaign (see §8.2).

Access to Alarm mode configuration (see §8.1).

The ▶ and ✋ icons have the following functions:
■ ▶: Validating the programming of a campaign and starting the alarm campaign.
■ ✋ : Voluntary stoppage of alarm campaign.

8.1. ALARM MODE CONFIGURATION

The 🔧 submenu displays the list of alarms configured (see §4.10). This shortcut key lets you define or change alarm configurations.
The following information is displayed.

Press ↩ to return to the Programming a campaign screen.

8.2. PROGRAMMING AN ALARM CAMPAIGN

The 💾 submenu is used to specify the start and stop times for an alarm campaign (see figure 66).

To program an alarm campaign, enter the start date and time, the stop date and time, and the name of the campaign.

To modify an item, move the yellow cursor to it using the ▲ and ▼ keys, then validate with the ↵ key. Change the value using the ▲,▼,◄ and ► keys, then validate again.

The name can be at most 8 characters long. Several campaigns may have the same name. The available alphanumeric characters are the uppercase letters from A to Z and the digits from 0 to 9. The last 5 names given (in the transient, trend, and alarm modes) are kept in memory. When a name is entered, it may then be completed automatically.

Notes: The start date and time must be later than the current date and time.

The stop date and time must be later than the start date and time.

It is not possible to program an alarm campaign if an inrush current capture is in progress.

Once the programming is done, start the campaign by pressing the ▶ key. The ▶ icon of the status bar blinks to indicate that the campaign has been started. The ✋ key replaces the ▶ key and can be used to stop the campaign before it is finished. Alarms in progress (not yet ended) are recorded in the campaign if their duration is equal to or greater than their programmed minimum duration.

The *Campaign on standby* message is displayed until the start time is reached. It is then replaced by the message *Campaign running*. When the stop time is reached, the *Programming a Campaign* screen returns with the ⏵ key. You can then program another campaign.

During an alarm campaign, only the stop date field can be modified. It is automatically highlighted in yellow.

8.3. DISPLAY OF THE LIST OF CAMPAIGNS

To display the list of campaigns performed, press the 📂 key. The *List of Alarm Campaigns* screen is displayed. The list can contain up to 7 campaigns.

Name of the campaign.

Start date and time of the campaign.

Stop date and time of the campaign.
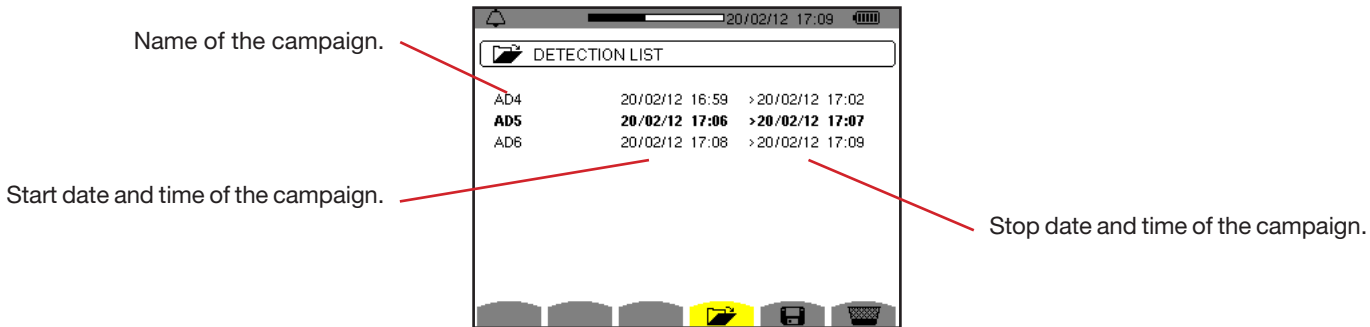

Figure 86: list of campaigns display screen

If the stop date of the campaign is in red, it means that it does not match the stop date initially programmed:
- either because of a power supply problem (battery low or disconnection of the device supplied by mains only),
- or because the memory is full.

8.4. DISPLAY OF LIST OF ALARMS

To select a campaign, move the cursor to it using the ▲ and ▼ keys. The selected field is bolded. Then validate with the ↵ key. The device then displays the alarms in list form.

Level of filling dedicated to the alarm mode. The black part of the bar corresponds to the fraction of memory used.

Alarm date and time.

Target of the alarm detected.

Type of alarm detected.

Alarm duration.

Extremum of the alarm detected (minimum or maximum depending on the programmed alarm direction).

The choice of filter is dynamic. It depends on the connection chosen.
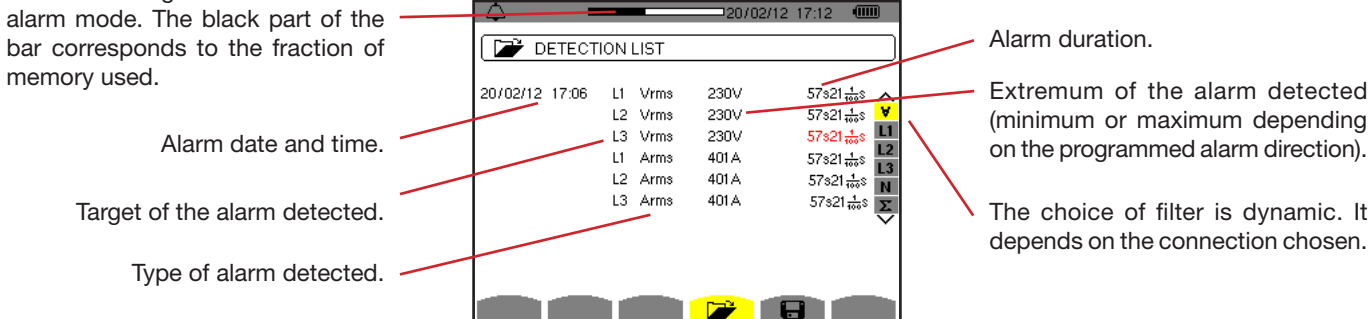

Figure 87: Alarm list screen

If an alarm duration is displayed in red, it means that it was cut short:
- because of a power supply problem (battery low),
- or because of a manual stoppage of the campaign (press on ✋) or deliberate switching off of the device (press on the ⏻ key).
- or because the memory is full.
- or because of a measurement error.
- or because of an incompatibility between the quantity monitored and the configuration of the device (for example withdrawal of a current sensor).

In the last two cases, the extremum is also displayed in red.

To return to the *List of campaigns* screen, press ↩.

8.5. DELETING AN ALARM CAMPAIGN

When the list of campaigns performed is displayed (see figure 86), select the campaign to be erased. This is done by moving the cursor to it using the ▲ and ▼ keys. The selected campaign is bolded.

Then press the 🟨 key. Press ↵ to validate or ↩ to cancel.

Note: It is not possible to delete the alarm campaign in progress.

8.6. ERASING ALL ALARM CAMPAIGNS

Erasing all of the alarm campaigns is possible only from the Configuration menu, in the *Erasure of Data* sub-menu (see §4.11)

9. TREND MODE

The ⌇ *Trend* mode records changes to parameters previously specified in the *Configuration / Trend mode* screen (see §4.9). This mode manages up to 2 GB of data.

Memory card usage.

Rapid programming and starting of recording (see §9.1).

Access to *Trend mode* configuration (see §4.9).

List of records (see §9.3).

Programming a recording (see §9.1).

Starting a recording (see §9.1).
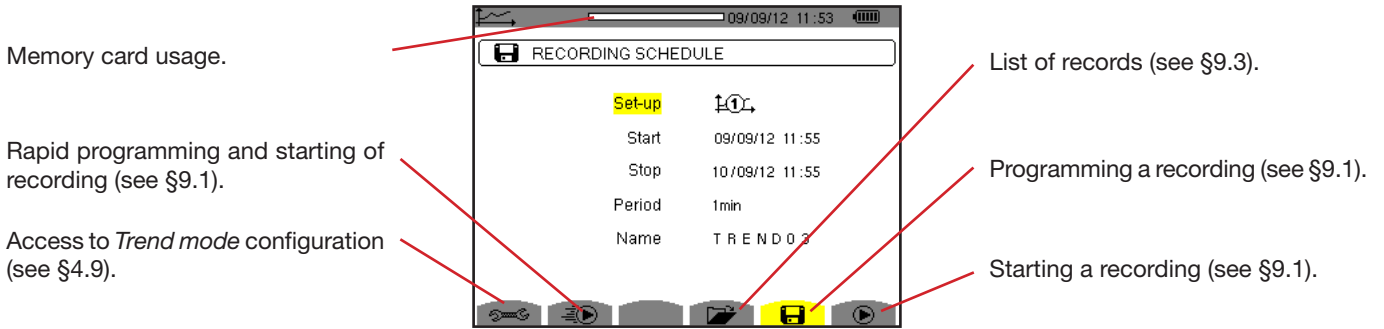

Figure 88: Trend mode screen

9.1. PROGRAMMING AND STARTING RECORDING

The 🖫 submenu specifies the characteristics of a recording (see figure 88).

To start a recording rapidly, press the ⧉ key. Recording starts immediately; all measurements are recorded every second until the memory or completely full. The configuration displayed is ⌶⦿⌇.

To program recording, before starting it, choose configuration ⌶①⌇ to ⌶④⌇, enter the start date and time, the stop date and time, the period, and the name of the recording.
To modify an item, move the yellow cursor to it using the ▲ and ▼ keys, then validate with the ↵ key. Change the value using the ▲,▼,◄ and ► keys, then validate again.

The integration period is the time over which the measurements of each recorded value are averaged (arithmetic mean). Possible values for the period are: 1 s, 5 s, 20 s, 1 min, 2 min, 5 min, 10 min and 15 min.

The name can be at most 8 characters long. Several recordings may have the same name. The available alphanumeric characters are the uppercase letters from A to Z and the digits from 0 to 9. The last 5 names given (in the transient, trend, and alarm modes) are kept in memory. When a name is entered, it may then be completed automatically.

Notes: The start date and time must be later than the current date and time.

The stop date and time must be later than the start date and time.

Once the programming is done, start recording by pressing the ⊙ key. If not enough memory is available, the device so indicates. The ⊙ icon of the status bar blinks to indicate that recording has begun. The ✋ key replaces the ⊙ key and can be used to stop the recording before it is finished.

The *Recording on standby* message is displayed until the start time is reached. It is then replaced by the message *Recording running* . When the stop time is reached, the *Program a Record* screen returns with the ⊙ key. You can then program a new recording.

During the recording of a trend, only the stop date field can be modified. It is automatically highlighted in yellow.

9.2. TREND MODE CONFIGURATION

The ⚒ submenu displays the list of trend recording configurations (see §4.9). This shortcut key lets you specify or modify the trend recording configurations.

9.3. VIEWING THE RECORDING LIST

The 📂 submenu displays the recording list already made.

Recording list memory usage. The black part of the bar corresponds to the fraction of memory used.

Recording name.

Recording start time.

Recording stop time.

Figure 89: Recording list display screen

If the stop date is in red, it means that it does not match the stop date initially programmed, because of a power supply problem (battery low or disconnection of the device supplied by mains only).

9.4. DELETING RECORDINGS

When the list of records is displayed (see figure 89), select the recording to be erased. This is done by moving the cursor to it using the ▲ and ▼ keys. The selected recording is bolded.

Then press the 🗑 key. Press ↵ to validate or ↩ to cancel.

9.5. VIEWING THE RECORDS

9.5.1. CHARACTERISTICS OF THE RECORD

When the list of records is displayed (see figure 89), select the record to be displayed. This is done by moving the cursor to it using the ▲ and ▼ keys. The selected recording is bolded. Then press ↵ to validate.

Types of measurement chosen in the configuration used.

The 🗗 icon is used to navigate in the following screen pages. It is also possible to use the ◀ or ▶ key.
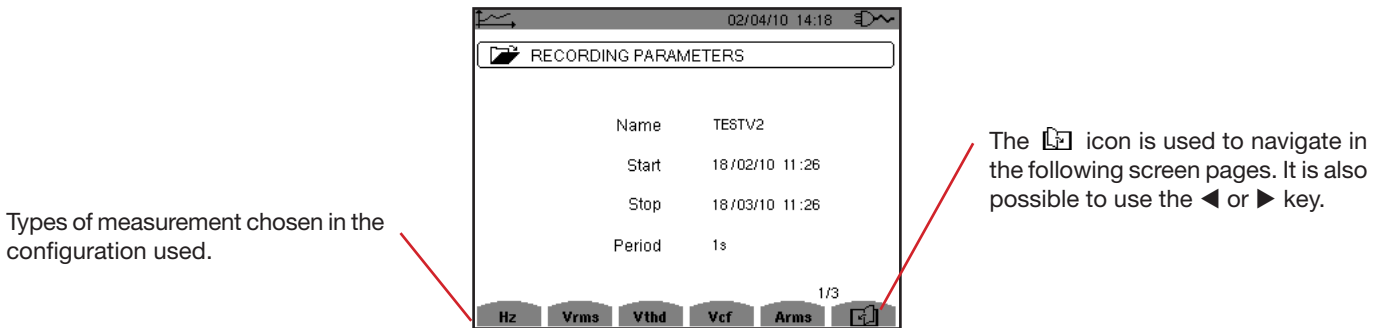

Figure 90: Recording list display screen

If a measurement does not appear in the tabs, it is because calculation of this measurement was incompatible with the configuration chosen (connection, types of sensors, ratios programmed).

For example, if the calculation mode chosen during the programming is Non-active Quantities not broken down (see §4.5.1), the D tab does not appear.

Press a yellow key to display the curve.

9.5.2. TREND CURVES

Date of the cursor.

Position of the viewing window in the record.

This screen is a partial view of the trend curve. There are other screens before and after the visible part.

To select the display filter, press the ▲ or ▼ key.

Use the ◄ or ► key to move the cursor.
Figure 91: Vrms (4L) without MIN-AVG-MAX

The display period of this curve is one minute. Since the period of the record is one second, each point of this curve corresponds to a value recorded in a one-second window once a minute. There is therefore a substantial loss of information (59 values out of 60), but the display is rapid.

Notes: Values of the cursor in red indicate saturated values.

Black dashes - - - - indicate erroneous values.

Red dashes - - - - indicate values that are not calculated (following the end of calculation of the MIN-MAX-AVG mode when 🖑 is pressed).

The MIN-AVG-MAX mode has been activated.

To change the scale of the display between 1 minute and 5 days.
Figure 92: Vrms (4L) with MIN-AVG-MAX

The display period of this curve is one minute. But with the MIN-AVG-MAX mode activated, each point of this curve represents the arithmetic mean of 60 values recorded every second. This display is therefore more precise, because there is no loss of information, but slower (see the table of figure 108).

To stop the calculation of the MIN-AVG-MAX mode, press 🖑 .

Remarks: While MIN-AVG-MAX mode is being calculated, a progress bar is displayed for this calculation in the status strip instead of the recording display window positioning bar.
The MIN-AVG-MAX mode is not available while a trend is being recorded.

To return to the *Characteristics of the Record* screen, press ↩.

To place the cursor on the first occurrence of the minimum value.

To place the cursor on the first occurrence of the maximum value.
Figure 93: Vrms (N) without MIN-AVG-MAX

Pressing the ›⊤‹ or ›⊥‹ key automatically sets the zoom in to the highest level (display period identical to the recording period) and de-activates the MIN-AVG-MAX mode if it was activated.

Curve of the maxima.

Curve of the mean.

Curve of the minima.

Values of the cursor (minimum, mean, and maximum).

Figure 94: Vrms (N) with MIN-AVG-MAX
The display period of this curve is one minute. Each point of the mean curve represents the arithmetic mean of 60 values recorded every second. Each point of the curve of the maxima represents the maximum of the 60 values recorded every second. Each point of the curve of the minima corresponds to the minimum of the 60 values recorded every second.

This display is therefore more precise than the previous one.

Date of the cursor.

This screen is a partial view of the trend curve. There are other screens before and after the visible part.

Use the ◀ or ▶ key to move the cursor.

Position of the viewing window in the record.

To select the display filter, press the ▲ or ▼ key.

Figure 95: Vrms (L1) without MIN-AVG-MAX
For each of the phases (L1, L2, and L3), at each recording of a value over one second (recording period), the device also records the minimum half-cycle RMS value over one second and the maximum half-cycle RMS value over one second. These are the three curves shown in the figure above.
The MIN-AVG-MAX mode has been activated.

Figure 96: Vrms (L1) with MIN-AVG-MAX

This curve differs slightly from the previous one because, with the MIN-AVG-MAX mode, there is no loss of information.

Note: For the quantities (P, Pdc, VAR, S, D, PF, cos Φ and tan Φ) and for a three-phase source without neutral, only the total quantities are represented.
Figure 97: tan Φ (L1) without MIN-AVG-MAX for a three-phase connection with neutral
Figure 98: tan Φ (L1) with MIN-AVG-MAX

The sum of the powers of the three phases (Σ) is presented in bargraph form.
To change the scale of the display between 1 minute and 5 days.

Figure 99: P (Σ) without MIN-AVG-MAX

For the energy curves, the quantities are expressed in Wh, J, toe, or BTU, depending on the unit chosen in the configuration of the device (see §4.5.2).
Figure 100: P (Σ) with MIN-AVG-MAX

This curve differs slightly from the previous one because, with the MIN-AVG-MAX mode, there is no loss of information.

The MIN-AVG-MAX mode can be activated for the powers to display, above the curve, the mean power value at the cursor date along with the maximum and minimum power values in the display period. Note that, in contrast with the other quantities, only the bar chart of mean values is represented.

Starting date of the selection.

Energy calculation mode. Pressing this key lets you define the start of the selection.

Date of the cursor (ending date of the selection). Use the ◄ or ► keys to move the cursor.
Figure 101: Ph (Σ) without MIN-AVG-MAX

The display period of this bar chart is one minute. Since the recording period is one second, each bar of this bar chart represents a value recorded in a one-second window once a minute.
The energy calculation mode determines the sum of the powers on the selected bars.
Figure 102: Ph (Σ) with MIN-AVG-MAX

With the MIN-AVG-MAX mode activated, the display differs slightly from the previous one because there is no loss of information.

Date of the cursor.

This screen is a partial view of the trend curve. There are other screens before and after the visible part.

Use the ◄ or ► keys to move the cursor.

Position of the viewing window in the record.

To select the display filter, press the ▲ or ▼ key.
Figure 103: cos Φ (L1) without MIN-AVG-MAX

The period of display of this curve is two hours. Since the recording period is one second, each point of this curve represents a value recorded every second taken every two hours. There is therefore a substantial loss of information (7,199 out of 7,200), but the display is rapid.

The MIN-AVG-MAX mode has been activated.

Figure 104: cos Φ (L1) with MIN-AVG-MAX

68
This curve differs considerably from the previous one, because the MIN-AVG-MAX mode is activated. Each point of the mean curve represents the arithmetic mean of 7,200 values recorded every second. Each point of the curve of the maxima represents the maximum of the 7,200 values recorded every second. Each point of the curve of the minima corresponds to the minimum of the 7,200 values recorded every second.

This display is therefore more precise, because there is no loss of information, but slower (see the table in figure 108).

The user can stop the loading of the recorded values and the calculation of the values displayed at any time by pressing this key.
Figure 105: cos Φ (L1) loading/calculation of values.
The dashes indicate that the value is not available at the cursor position because it was not calculated.

Figure 106: cos Φ (L1) loading/calculation of values aborted.

Display of the record is not complete because construction was stopped before the end.
To change the scale of the display between 1 minute and 5 days.

Figure 107: cos Φ (L1) loading/calculation of complete values without MIN-AVG-MAX for a three-phase connection with neutral.

The display has not been stopped and is therefore complete.

The following table indicates the time needed to display the curve on screen as a function of the width of the display window for a recording period of one second:

Width of display window (60 points or increments)	Grid increment	Typical waiting time for display with the MIN-AVG-MAX mode deactivated	Typical waiting time for display with the MIN-AVG-MAX mode activated
5 days	2 hours	11 seconds	10 minutes
2,5 days	1 hour	6 seconds	5 minutes
15 hours	15 minutes	2 seconds	1 minute 15 seconds
10 hours	10 minutes	2 seconds	50 seconds
5 hours	5 minutes	1 second	25 seconds
1 hour	1 minute	1 second	8 seconds
20 minutes	10 seconds	1 second	2 seconds
5 minutes	5 seconds	1 second	1 second
1 minute	1 second	1 second	1 second

Figure 108: Display Times table

These times can be long, so it has been made possible to stop the display at any time by pressing the ✋ key.

It is also possible, at any time:
- to press the 🔍⊕ or 🔍⊖ key to change the scale of the display,
- to press the ◄ or ► key to move the cursor,
- to press the ▲ or ▼ key to change the display filter.

But note that this may restart the loading and/or calculation of the values from the beginning.

10. POWER AND ENERGY MODE

The **W** key displays power- and energy-related measurements.

The sub-menus available depend on the filter.
- For 2- and 3-wire single-phase connections and for the 2-wire two-phase connection, only selection L1 is available. The filter is therefore not displayed, but the display is the same as for L1.
- For the 3-wire three-phase connection, only the Σ selection is available. The filter is therefore not displayed, but the display is the same as for Σ.

10.1. 3L FILTER

10.1.1. THE POWERS DISPLAY SCREEN

The **W...** sub-menu is used to display the powers.

Active power.

DC power (only if a DC current sensor is connected).

Reactive power.

Distortion power.

Apparent power.
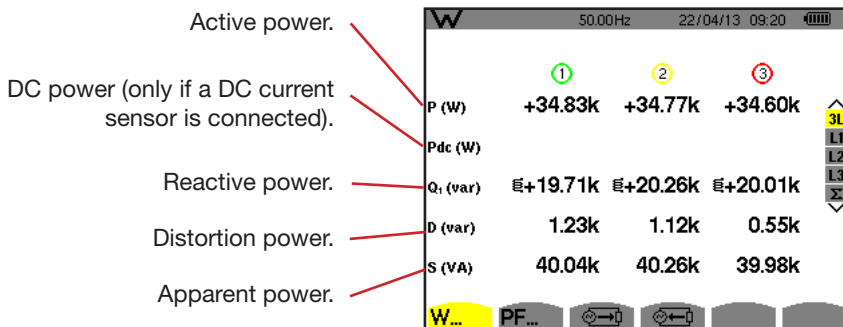

Figure 109: the 3L Powers screen.

Note: This screen corresponds to the choice "non-active quantities broken down" in the AR tab of the Calculation Methods menu of the Configuration mode. If the choice had been "non-active quantities not broken down", then the D label (distortion power) would have disappeared and the Q_1 label would have been replaced by the N label. This non-active power is un-signed and has no inductive or capacitive effect.

10.1.2. THE QUANTITIES ASSOCIATED WITH THE POWERS DISPLAY SCREEN

The **PF** sub-menu**...** displays the quantities associated with the powers.

Power factor.

Fundamental power factor (also called displacement factor - DPF).

Tangent of the phase shift.

Phase shift of the voltage with respect to the current.

Figure 110: the Quantities Associated with the Powers screen in 3L

10.1.3. THE ENERGIES CONSUMED DISPLAY SCREEN

The ⬒ sub-menu displays the meters of energy consumed by the load.

Active energy.

DC energy (only if a DC current sensor is connected).

Reactive energy.

Distortion energy.

Apparent energy.

Inductive reactive effect.

Capacitive reactive effect.
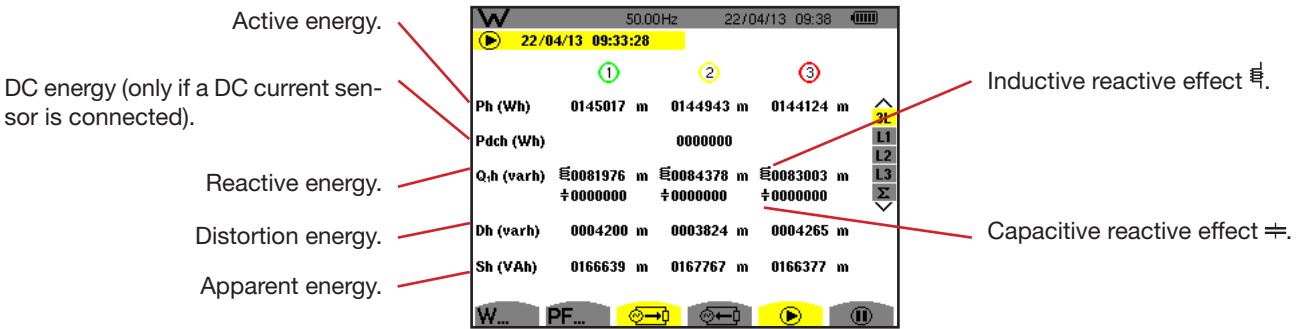

Figure 111: the Energies Consumed display screen in 3L

Note: This screen corresponds to the choice "non-active quantities broken down" in the VAR tab of the Calculation Methods menu of the Configuration mode. If the choice had been "non-active quantities not broken down", then the Dh label (distortion energy) would have disappeared and the Q_1h label would have been replaced by the Nh label. This non-active energy has no inductive or capacitive effect.

10.1.4. THE ENERGIES GENERATED DISPLAY SCREEN

The ⬒ sub-menu displays the meters of the energy generated by the load.

Active energy.

DC energy (only if a DC current sensor is connected).

Reactive energy.

Distortion energy.

Apparent energy.

Inductive reactive effect.

Capacitive reactive effect.
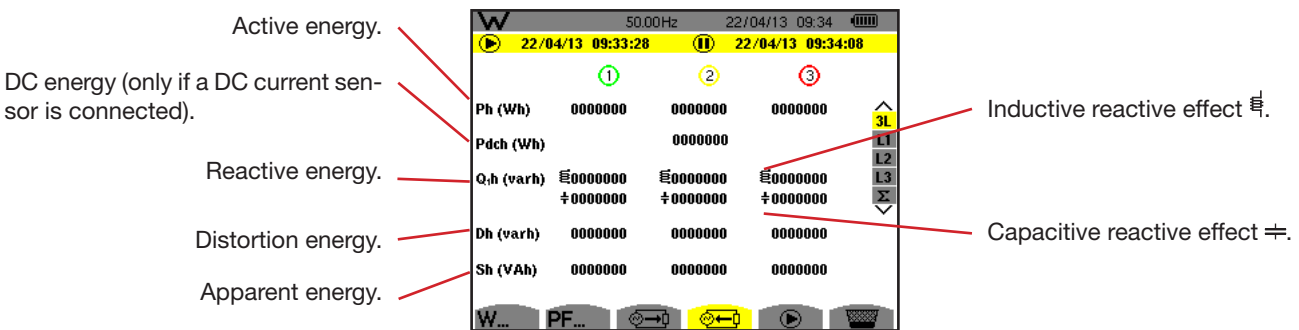

Figure 112: the Energies Generated display screen in 3L

Note: This screen corresponds to the choice "non-active quantities broken down" in the VAR tab of the Calculation Methods menu of the Configuration mode. If the choice had been "non-active quantities not broken down", then the Dh label (distortion energy) would have disappeared and the Q_1h label would have been replaced by the Nh label. This non-active energy has no inductive or capacitive effect.

10.2. FILTERS L1, L2 AND L3

10.2.1. THE POWERS AND ASSOCIATED QUANTITIES DISPLAY SCREEN

The **W...** sub-menu displays the powers and associated quantities.

Active power.

DC power.

Reactive power.

Distortion power.

Apparent power.

Power factor (PF).

Fundamental power factor (also called displacement factor - DPF).

Tangent of the phase shift.

Phase shift of voltage with respect to current.
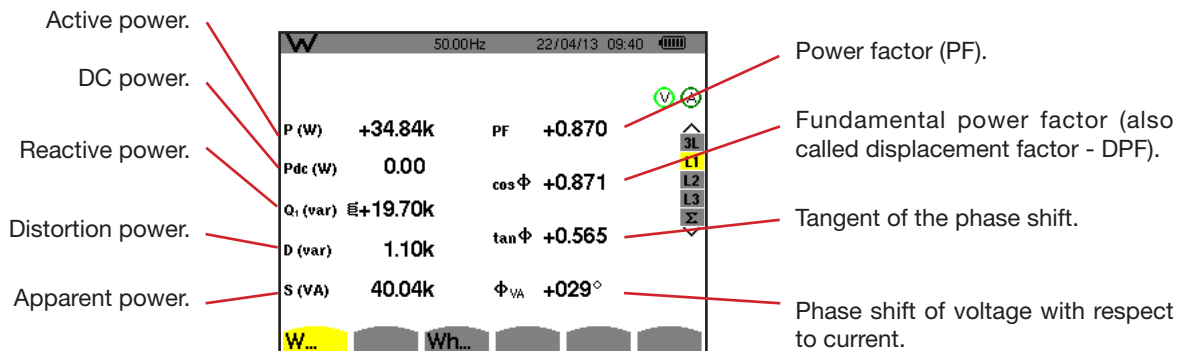

Figure 113: the Powers and Associated Quantities display screen in L1

Notes: This screen corresponds to the choice "non-active quantities broken down" in the VAR tab of the Calculation Methods menu of the Configuration mode. If the choice had been "non-active quantities not broken down", then the D label (distortion power) would have disappeared and the Q_1 label would have been replaced by the N label. This non-active power has no inductive or capacitive effect.

Filters L2 and L3 display the same information for phases 2 and 3.

Φ_{UA} is displayed for the 2-wire two-phase set-up.

10.2.2. THE ENERGY METERS DISPLAY SCREEN

The **Wh...** sub-menu displays the energy meters.

Meters of the energy consumed by the load.

Meters of the energy generated by the load.

Active energy.

DC energy (only if a DC current sensor is connected).

Reactive energy.

Distortion energy.

Apparent energy.

Inductive reactive effect.

Capacitive reactive effect.

Figure 114: the Energies Consumed and Generated display screen in L1

Notes: This screen corresponds to the choice «non-active quantities broken down» in the VAR tab of the Calculation Methods menu of the Configuration mode. If the choice had been «non-active quantities not broken down», then the Dh label (distortion energy) would have disappeared and the Q_1h label would have been replaced by the Nh label. This non-active energy has no inductive or capacitive effect.

Filters L2 and L3 display the same information for phases 2 and 3.

10.3. FILTER Σ

10.3.1. THE TOTAL POWERS AND ASSOCIATED QUANTITIES DISPLAY SCREEN

The **W...** sub-menu displays the powers and associated quantities.

Total active power.

Total DC power.

Total reactive power.

Total distortion power.

Total apparent power.

Total power factor.

Total fundamental power factor (also called displacement factor - DPF).

Total tangent.

Figure 115: the Total Powers and Associated Quantities display screen in Σ

Note: This screen corresponds to the choice "non-active quantities broken down" in the VAR tab of the Calculation Methods menu of the Configuration mode. If the choice had been "non-active quantities not broken down", then the D label (distortion power) would have disappeared and the Q_1 label would have been replaced by the N label. This non-active power has no inductive or capacitive effect.

10.3.2. THE TOTAL ENERGY METERS DISPLAY SCREEN

The **Wh...** sub-menu displays the energy meters.

Meters of energy consumed by the load.

Meters of the energy generated by the load.

Total active energy.

Total DC energy (only if a DC current sensor is connected).

Total inductive reactive effect.

Total reactive energy.

Total distortion energy.

Total capacitive reactive effect.

Total apparent energy.
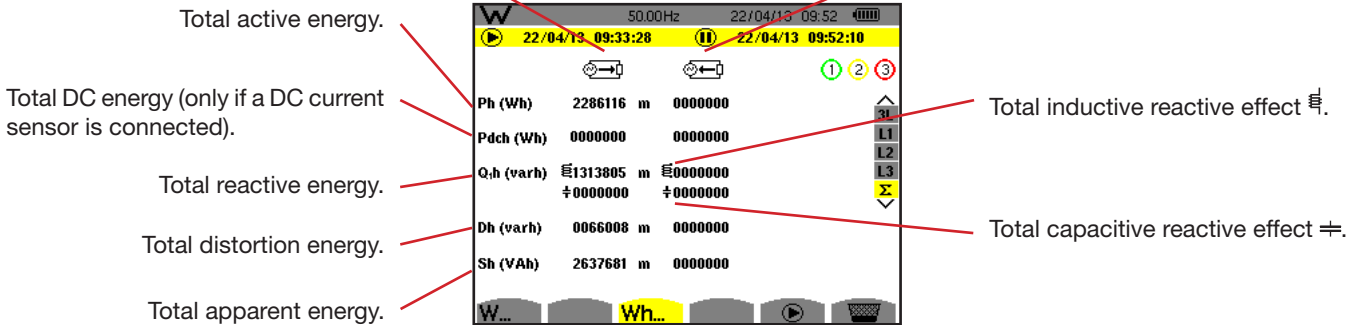

Figure 116: the Total Energies Consumed and Generated display screen in Σ

Notes: This screen corresponds to the choice "non-active quantities broken down" in the VAR tab of the Calculation Methods menu of the Configuration mode. If the choice had been "non-active quantities not broken down", then the Dh label (distortion energy) would have disappeared and the Q_1h label would have been replaced by the Nh label. This non-active energy has no inductive or capacitive effect.

For the 3-wire three-phase set-up, only the display of total quantities is available, the method of calculation of the powers used is the two-wattmeter method (with 2 sensors connected) or the three-wattmeter method with virtual neutral (with 3 sensors connected) (see Appendix, §16.1.4.3).

10.4. STARTING ENERGY METERING

To start an energy metering, press the ⏵ key in an energies display screen (⌦➔◻, ⌦◅◻, or **Wh...**).

The start date and time of the energy metering.

The ⏸ icon is used to suspend the energy metering.
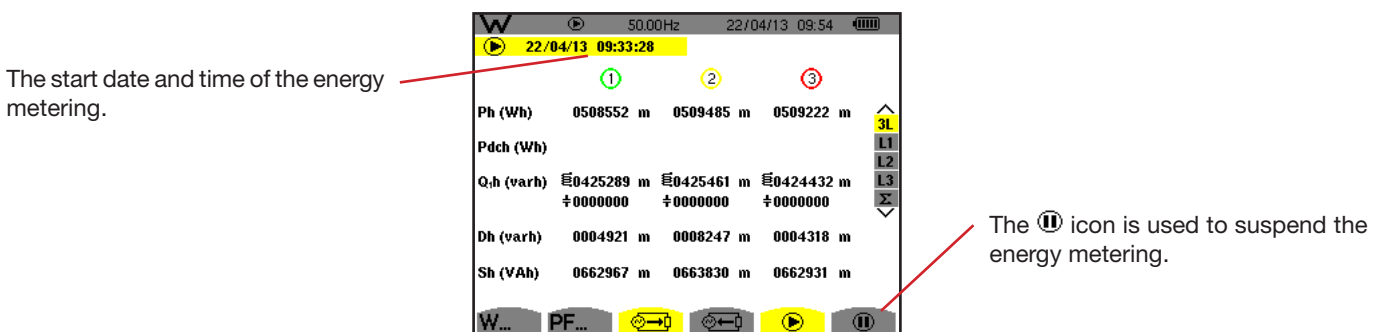

Figure 117: the Energy Metering Start-up screen in Wh

The blinking ⏵ symbol indicates that energy metering is in progress.
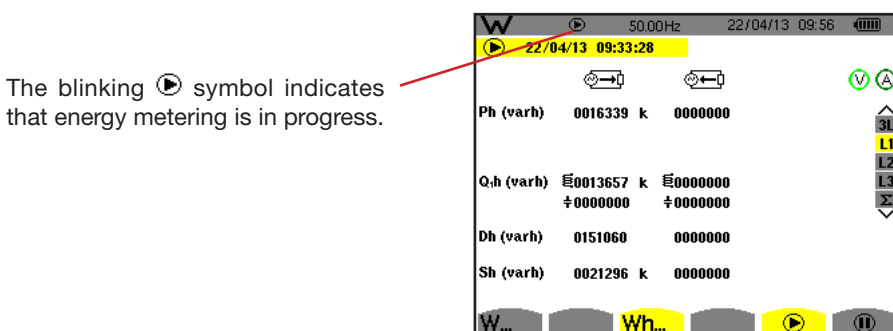

Figure 118: the Energy Metering screen in varh

The diagram used is the 4-quadrant diagram (see §16.5).

Note: The non-nullity threshold is 11.6 kWh for non-nuclear toe and 3.84 kWh for nuclear toe.

10.5. DISCONNECTION OF ENERGY METERING

To suspend energy metering, press ⏸.

Figure 119: the Energy Metering screen in varh
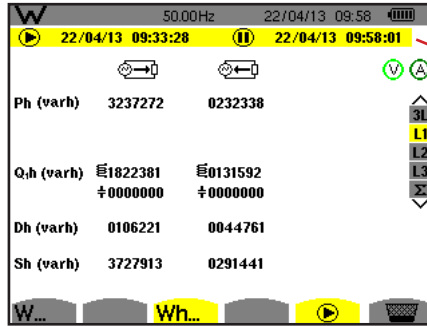

The stop date and time of the metering are displayed alongside the start date and time.

A disconnection of the metering is not definitive. It can be resumed by pressing the ▶ key again.

Note: If no recording is in progress, then disconnecting the energy metering leads to the appearance of the blinking ▶ symbol in the status bar (in place of the ⏸ symbol). Disconnecting the energy metering also leads to the replacement of the ⏸ key by the 🗑 key.

10.6. RESET OF ENERGY METERING
To suspend the metering, press the ⏸ key. Then, to reset energy metering, press the 🗑 key and validate with the ↵ key. All energy values (consumed and generated) are then reset.
11. SCREEN SNAPSHOT MODE

The 📷 key can be used to take up to 50 screen snapshots and display the recorded snapshots.

Saved screens may then be transferred to a PC using the PAT application (Power Analyser Transfer).

11.1. SCREEN SNAPSHOTS

Press the key for approx. 3 seconds to shoot any screen .

When a screen snapshot is taken, the icon of the active mode (⌇, ⊞, ▐▄▖, ⌒, △ , ⌇, W) in the top strip of the display unit is replaced by the 📷 icon. You can then release the 📷 key .

The device can record only 50 screen snapshots. If you want to record a 51st screen, the device informs you that snapshots must be deleted by displaying the 🗑 icon in place of 📷 .

11.2. HANDLING OF SCREEN SNAPSHOTS

To enter screen snapshot mode, briefly press the 📷 key. The device then displays a list of recorded screen snapshots.

Indicator of available image memory. The black bar represents memory used and the white bar represents memory available.

Icons for browsing in screen pages.

List of saved snapshots. Each icon represents the type of screen recorded. It is followed by the date and time of the screen snapshot.

Display of the list of screen snapshots.

Deleting a screen snapshot.
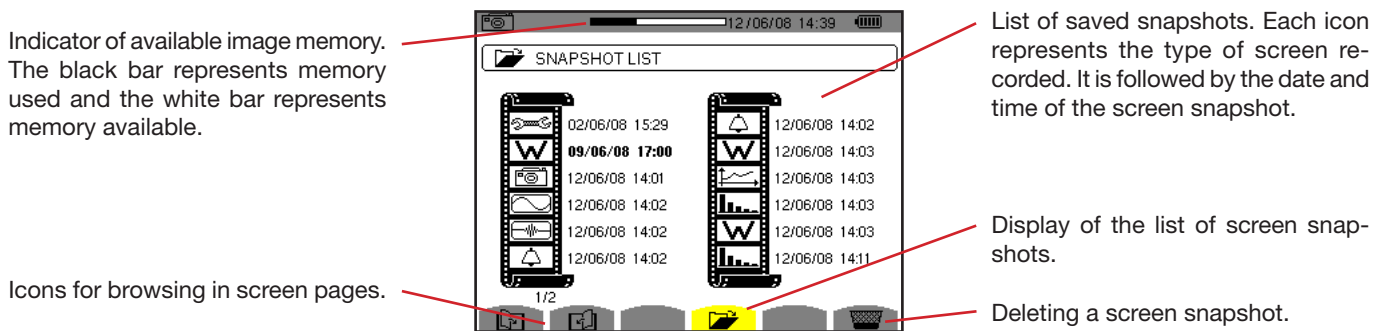

Figure 120: the List of Screen Snapshots display screen

11.2.1. VIEWING A SNAPSHOT FROM THE LIST

To view a snapshot, select it in the list of screen snapshots using the ▲, ▼, ◄ and ► keys. The date and time of the selected snapshot are bolded.

Press ↵ to display the selected snapshot. The 📷 icon is displayed in alternation with the icon for the mode that was active when the snapshot was taken (⌇, ⊞, ▐▄▖, ⌒, △ , ⌇, W).

Press ⮌ to return to the list of screen snapshots.

11.2.2. DELETING A SNAPSHOT FROM THE LIST

To delete a snapshot, select it in the list of screen snapshots using the ▲, ▼, ◄ and ► keys. The date and time of the selected snapshot are bolded.

Press the 🗑 key and validate by pressing ↵. The snapshot then disappears from the list.
To cancel the deletion, press ⮌ rather than ↵.

12. HELP KEY

The ⑦ key provides information about the key functions and symbols used in the current display mode.

The following information is displayed:

Reminder of the mode used.

Help in progress.

Help page 2.

Help page 1.

List of information concerning the keys and icons.
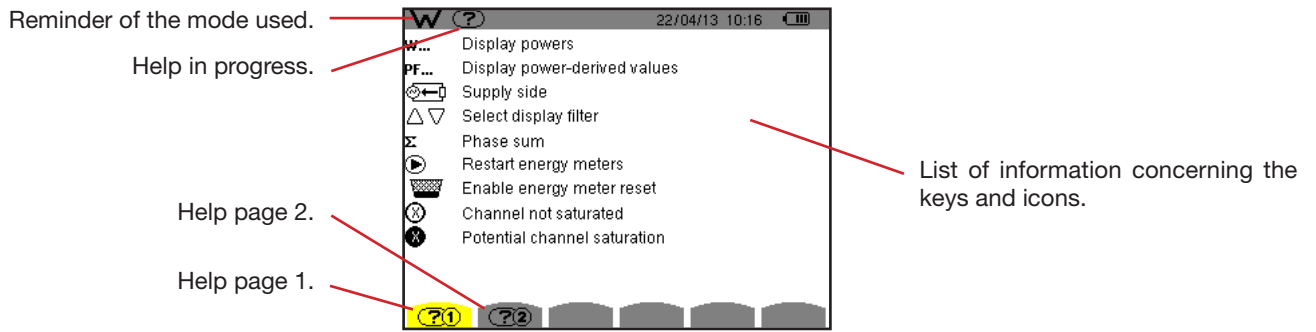

Figure 121: The help screen for the powers and energies mode, page 1

List of symbols used on the page.
Figure 122: the screen of the help page for the powers and energies mode, page 2

13. DATA EXPORT SOFTWARE

The PAT2 (*Power Analyser Transfer 2*) data export software supplied with the device is used to transfer the data recorded in the device to a PC.

To install it, load the installation CD in the CD drive of your PC, then follow the instructions on screen.
Then connect the device to the PC using the USB cord supplied, after removing the cover that protects the USB port on the device.
Switch the device on by pressing the key and wait for your PC to detect it.

The PAT transfer software automatically defines the communication rate between the PC and the device.

Note: All measurements recorded in the device can be transferred to the PC. The transfer does not erase the recorded data unless the user explicitly asks it to.

For directions for using the data export software, use its Help function or refer to its user manual.

14. GENERAL SPECIFICATIONS

14.1. ENVIRONMENTAL CONDITIONS

The following chart shows conditions relating to ambient temperature and humidity:

1 = Reference range.
2 = Range for use.
3 = Range for storage with batteries.
4 = Range for storage without batteries.
Caution: at temperatures above 40°C, the device must be powered by the battery alone **OR** by the mains power unit alone; use of the device with both the battery **AND** the mains power unit is **prohibited**.

Altitude :
Use < 2 000 m
Storage < 10 000 m

Degree of pollution : 2.

Use indoors.

14.2. MECHANICAL CONDITIONS

Dimensions (L x W x H)	200 mm x 250 mm x 70 mm
Weight	approximately 2 kg
Screen	118 mm x 90 mm, diagonal 148 mm

Tightness
- IP53 per EN 60529 when the device is on its stand, with no lead connected, with the jack cover and the cap on the USB connector in the closed position
- IP20 at the level of the measurement terminals
- IK08 per EN 62262

Fall   1 m as per IEC 61010-1

14.3. OVERVOLTAGE CATEGORIES PER IEC 61010-1

The device is compliant with IEC 61010-1, 600 V category IV or 1000 V category III.
- the use of AmpFLEX™ or of MiniFLEX or C193 clamps keeps the "device + current sensor" system at 600 V category IV or 1000 V category III.
- the use of PAC93, J93, MN93, MN93A, or E3N clamps downgrades the "device + current sensor" system to 300 V category IV or 600 V category III.
- the use of the 5 A adapter unit downgrades the "device + current sensor" system to 150 V category IV or 300 V category III.

Double insulation between the inputs/outputs and earth.
Double insulation between the voltage inputs, the power supply, and the other inputs/outputs.

14.4. ELECTROMAGNETIC COMPATIBILITY

Emissions and immunity in an industrial setting compliant with IEC 61326-1.

As regards electromagnetic emissions, the device belongs to group 1, class A, under standard EN55011. Class A devices are intended for use in industrial environments. There may be difficulties ensuring electromagnetic compatibility in other environments, because of conducted and radiated disturbance.

As regards immunity to radio frequency fields, the device is equipment intended for use at industrial sites under standard IEC61326-1.

For the Amp*FLEX*™ and Mini*FLEX* sensors:
- An (absolute) influence of 2% may be observed on the current THD measurement in the presence of a radiated electric field.
- An influence of 0.5 A may be observed on the RMS current measurement in the presence of conducted radio frequencies.
- An influence of 1 A may be observed on the RMS current measurement in the presence of a magnetic field.

14.5. POWER SUPPLY

14.5.1. MAINS POWER SUPPLY
This is a specific 600 V$_{RMS}$, category IV – 1000 V$_{RMS}$, category III external mains power supply unit.

Range of use: 230 V ± 10 % @ 50 Hz and 120 V ± 10 % @ 60 Hz.

Maximum input power: 65 VA.

14.5.2. BATTERY POWER SUPPLY

The device is supplied by a 9.6 V, 4000 mAh battery pack, comprising 8 rechargeable NiMH elements.

Battery	8 NiMH storage cells.
Capacity	4000 mAh nominal.
Nominal voltage	1,2 V per cell, or a total of 9.6 V.
Life	at least 300 charge-discharge cycles.
Charging current	1 A.
Charging time	approx. 5 hours
Service T°	[0 °C ; 50 °C].
Charging T°	[10 °C ; 40 °C].
Storage T°	storage ≤ 30 days: [-20 °C ; 50 °C].
	storage for 30 to 90 days: [-20 °C ; 40 °C].
	storage for 90 days to 1 year: [-20 °C ; 30 °C].

If the device is to be left unused for an extended period, remove the battery (see § 17.3).

14.5.3. CONSUMPTION

Typical consumption of the device on mains (mA)	Battery being charged	Battery charged
Active power (W)	17	6
Apparent power (VA)	30	14
RMS current (mA)	130	60

14.5.4. BATTERY LIFE

Battery life is 10 hours when the battery delivered with the device is fully charged, with the display screen on. If the display screen is off (saving energy), battery life is more than 15 hours.

14.5.5. DISPLAY UNIT

The display unit is an active matrix (TFT) LCD type having the following characteristics:

- 5.7" diagonal
- resolution 320 x 240 pixels (1/4 VGA)
- colour
- minimum luminosity 210 cd/m², typical 300 cd/m²
- response time between 10 and 25 ms
- angle of view 80° in all directions
- excellent rendering from 0 to 50°C

15. FUNCTIONAL CHARACTERISTICS

15.1. REFERENCE CONDITIONS

This table indicates the reference conditions of the quantities to be used by default in the characteristics indicated in § 15.3.4.

Parameter	Reference conditions
Ambient temperature	23 ± 3 °C
Humidity (relative humidity)	[45 % ; 75 %]
Atmospheric pressure	[860 hPa ; 1060 hPa]
Phase-to-neutral voltage	[50 VRMS ; 1000 VRMS] without DC (< 0.5 %)
Standard current circuit input voltage (Except *FLEX* type current sensors)	[30 mVRMS ; 1 VRMS] without DC (< 0.5 %) ■ A_{nom} [1] ⟺ 1 VRMS ■ $3 \times A_{nom}$ [1] ÷ 100 ⟺ 30 mVRMS
Unamplified Rogowski current circuit input voltage (*FLEX* type current sensors)	[11.73 mVRMS ; 391 mVRMS] without DC (< 0,5 %) ■ 10 kARMS ⟺ 391 mVRMS to 50 Hz ■ 300 ARMS ⟺ 11.73 mVRMS to 50 Hz
Amplified Rogowski current circuit input voltage (*FLEX* type current sensors)	[117.3 µVRMS ; 3.91 mVRMS] without DC (< 0,5 %) ■ 100 ARMS ⟺ 3.91 mVRMS to 50 Hz ■ 3 ARMS ⟺ 117.3 µVRMS to 50 Hz
Frequency of electrical network	50 Hz ± 0,1 Hz or 60 Hz ± 0,1 Hz
Phase shift	0° (active power and energy) 90° (reactive power and energy)
Harmonics	< 0,1 %
Voltage unbalance	< 10 %
Voltage ratio	1 (unity)
Current ratio	1 (unity)
Voltages	measured (not calculated)
Current sensors	actual (not simulated)
Power supply	Battery only
Electric field	< 1 V.m^{-1} for [80 MHz ; 1 GHz[≤ 0,3 V.m^{-1} for [1 GHz ; 2 GHz[≤ 0,1 V.m^{-1} for [2 GHz ; 2,7 GHz]
Magnetic field	< 40 A.m^{-1} DC (earth's magnetic field)

(1) The values of A_{nom} are given in the table below.

15.2. NOMINAL CURRENT ACCORDING TO TYPE OF SENSOR

Current sensor (except *FLEX*)	Nominal RMS current (A_{nom}) [A]	Lower limit of the reference range ($3 \times A_{nom} \div 100$) [A]
J93 clamp	3500	105
C193 clamp	1000	30
PAC93 clamp	1000	30
MN93 clamp	200	6
MN93A clamp (100 A)	100	3
E3N clamp (10 mV/A)	100	3
E3N clamp (100 mV/A)	10	0.3
MN93A clamp (5 A)	5	0.15
5 A adapter	5	0.15
Essailec® adapter	5	0.15

15.3. ELECTRICAL CHARACTERISTICS

15.3.1. VOLTAGE INPUT CHARACTERISTICS

Range for use: 0 V_{RMS} to 1000 V_{RMS} AC+DC phase-to-neutral and neutral-to-earth.
                        0 V_{RMS} to 2000 V_{RMS} AC+DC phase-to-phase.
                        (on condition of compliance with 1000 V_{RMS} with respect to earth in Cat III).

Input impedance: 1195 kΩ (between phase and neutral and between neutral and earth).

Admissible overload: 1200 V_{RMS} constant.
                        2000 V_{RMS} for one second.

15.3.2. CURRENT INPUT CHARACTERISTICS

Operating range: [0 V ; 1 V]

Input impedance: 1 MΩ.

Admissible overload: 1.7 V_{RMS} constant.

FLEX type current sensors (Amp*FLEX*™ and Mini*FLEX*) switch the current input to an integrator assembly (amplified or unamplified Rogowski channel) capable of interpreting the signals from Rogowski sensors. The input impedance is reduced to 12.4 kΩ in this case.

15.3.3. BANDWIDTH

Measurement channels: 256 points per period, i.e.:
- At 50 Hz: 6.4 kHz (256 × 50 ÷ 2).
- At 60 Hz: 7.68 kHz (256 × 60 ÷ 2).

The analogue 3-dB bandwidth: 76 kHz.

15.3.4. CHARACTERISTICS OF THE DEVICE ALONE (EXCLUDING THE CURRENT SENSOR)

Quantities concerning currents and voltages

Measurement		Measurement range without ratio (with unity ratio)		Display resolution (with unity ratio)	Maximum intrinsic error
		Minimum	Maximum		
Frequency		40 Hz	70 Hz	10 mHz	±10 mHz
RMS voltage[5]	simple	2 V	1,000 V [1]	100 mV V < 1000 V	±(0.5 % + 200 mV)
				1 V V ≥ 1000 V	±(0.5 % + 1 V)
	compound	2 V	2,000 V [2]	100 mV U < 1000 V	±(0.5 % + 200 mV)
				1 V U ≥ 1000 V	±(0.5 % + 1 V)
Direct voltage (DC)[6]	simple	2 V	1,200 V [3]	100 mV V < 1000 V	±(1 % + 500 mV)
				1 V V ≥ 1000 V	±(1 % + 1 V)
	compound	2 V	2,400 V [3]	100 mV U < 1000 V	±(1 % + 500 mV)
				1 V U ≥ 1000 V	±(1 % + 1 V)
RMS ½ voltage	simple	2 V	1,000 V [1]	100 mV V < 1000 V	±(0.8 % + 1 V)
				1 V V ≥ 1000 V	
	compound	2 V	2,000 V [2]	100 mV U < 1000 V	±(0.8 % + 1 V)
				1 V U ≥ 1000 V	
Peak voltage	simple	2 V	1,414 V [4]	100 mV V < 1000 V	±(3 % + 2 V)
				1 V V ≥ 1000 V	
	compound	2 V	2,828 V [4]	100 mV U < 1000 V	±(3 % + 2 V)
				1 V U ≥ 1000 V	
Severity of short-term flicker (PST)		0	12	0.01	See the corresponding table
Severity of long-term flicker (PLT)		0	12	0.01	Uncertainty of PST
Peak factor (PF) (voltage and current)		1	9.99	0.01	±(1 % + 5 ct) CF < 4
					±(5 % + 2 ct) CF ≥ 4

(1) In 1,000 V_{RMS}, category III, provided that the voltage between each of the terminals and earth does not exceed 1,000 V_{RMS}.
(2) Two-phase (opposite phases) – same note as (1).
(3) Limitation of the voltage inputs.
(4) 1000 x $\sqrt{2}$ ≈ 1414; 2000 x $\sqrt{2}$ ≈ 2828;
(5) Total RMS value and RMS value of the fundamental
(6) DC harmonic component (n= 0)

Quantities concerning powers and energies

Measurement		Measurement range without ratio (with unity ratio)		Display resolution (with unity ratio)	Maximum intrinsic error
		Minimum	Maximum		
Active power (P) [1]	Excluding *FLEX*	10 mW [3]	10 MW [4]	4 digits at most [5]	±(1 %) cos Φ ≥ 0.8
					±(1.5 % + 10 ct) 0.2 ≤ cos Φ < 0.8
	Amp*FLEX*™ Mini*FLEX*				±(1 %) cos Φ ≥ 0.8
					±(1.5 % + 10 ct) 0.5 ≤ cos Φ < 0.8
Reactive power (Q₁) [2] and non-active (N)	Excluding *FLEX*	10 mvar [3]	10 Mvar [4]	4 digits at most [5]	±(1 %) sin Φ ≥ 0.5
					±(1.5 % + 10 ct) 0.2 ≤ sin Φ < 0.5
	Amp*FLEX*™ Mini*FLEX*				±(1.5 %) sin Φ ≥ 0.5
					±(2.5 % + 20 ct) 0.2 ≤ sin Φ < 0.5
Distortion power (D) [7]		10 mvar [3]	10 Mvar [4]	4 digits at most [5]	±(4 % + 20 ct) if ∀ n ≥ 1, τ_n ≤(100 ÷ n) [%]
					or
					±(2 % +(n_{max} × 0,5 %) + 100 ct) THD_A ≤ 20 %f
					±(2 % +(n_{max} × 0,7 %) + 10 ct) THD_A > 20 %f
Apparent power (S)		10 mVA [3]	10 MVA [4]	4 digits at most [5]	±(1 %)
DC power (Pdc)		20 mVA [8]	6 MVA [9]	4 digits at most [5]	
Peak factor (PF)		-1	1	0.001	±(1.5 %) cos Φ ≥ 0.5
					±(1.5 % + 10 ct) 0.2 ≤ cos Φ < 0.5
Active energy (Ph) [1]	Excluding *FLEX*	1 mWh	9,999,999 MWh [6]	7 digits at most [5]	±(1 %) cos Φ ≥ 0.8
					±(1.5 %) 0.2 ≤ cos Φ < 0.8
	Amp*FLEX*™ Mini*FLEX*				±(1 %) cos Φ ≥ 0.8
					±(1.5 %) 0.5 ≤ cos Φ < 0.8
Reactive energy (Q₁h) [2] and non-active energy (N) [2]	Excluding *FLEX*	1 mvarh	9,999,999 Mvarh [6]	7 digits at most [5]	±(1 %) sin Φ ≥ 0.5
					±(1.5 %) 0.2 ≤ sin Φ < 0.5
	Amp*FLEX*™ Mini*FLEX*				±(1.5 %) sin Φ ≥ 0.5
					±(2.5 %) 0.2 ≤ sin Φ < 0.5
Distortion energy (Dh)		1 mvarh	9,999,999 Mvarh [6]	7 digits at most [5]	±(5.5 %) THD_A ≤ 20 %f
					±(1.5 %) THD_A > 20 %f
Apparent energy (Sh)		1 mVAh	9,999,999 MVAh [6]	7 digits at most [5]	±(1 %)
DC energy (Pdch)		1 mWh	9,999,999 MWh [10]	7 digits at most [5]	

(1) The stated uncertainties on the active power and energy measurements are maxima for |cos Φ| = 1 and typical for the other phase differences.
(2) The stated uncertainties on the reactive power and energy measurements are maxima for |sin Φ| = 1 and typical for the other phase shifts.
(3) With MN93A clamp (5 A) or 5 A adapter or Essailec® adapter.
(4) With Amp*FLEX*™ or Mini*FLEX* for a 2-wire single-phase connection (phase-to-ground voltage).
(5) The resolution depends on the current sensor used and on the value to be displayed.
(6) The energy is equivalent to more than 114 years of the associated maximum power (unity ratios).

(7) n_{max} is the highest order for which the harmonic ratio is non-zero.
(8) With E3N clamp (100 mV/A)
(9) With J93 clamp, for a 2-wire single-phase connection (phase-to-ground voltage).
(10) The energy corresponds to more than 190 years at maximum power Pdc (unit ratios).

Quantities associated with power

Measurement	Measurement range		Display resolution	Maximum intrinsic error
	Minimum	Maximum		
Phase differences of fundamentals	-179°	180°	1°	±2°
cos Φ (DPF)	-1	1	0.001	±1° for Φ ±5 ct for cos Φ
tan Φ	-32.77 [(1)]	32.77 [(1)]	0.001 tan Φ < 10	±1° for Φ
			0.01 tan Φ ≥ 10	
Voltage unbalance (UNB)	0 %	100 %	0.1 %	±3 ct UNB ≤ 10%
				±10 ct UNB > 10%
Current unbalance (UNB)	0 %	100 %	0.1 %	±10 ct

(1) |tan Φ| = 32,767 corresponds to Φ = ±88.25° + k × 180° (k being a natural number)

Quantities concerning the spectral composition of the signals

Measurement	Measurement range		Display resolution	Maximum intrinsic error
	Minimum	Maximum

				100 mA A ≥ 100 A	

(1) n_{max} is the highest order for which the harmonic ratio is non-zero.

Severity of short-term flicker

Rectangular variations per minute (50% duty cycle)	Maximum intrinsic error of the short-term flicker severity measurement (PST)			
	120 V lamp 60 Hz network		230 V lamp 50 Hz network	
1	PST ∈ [0.5 ; 4]	± 5%	PST ∈ [0.5 ; 4]	± 5%
2	PST ∈ [0.5 ; 5]	± 5%	PST ∈ [0.5 ; 5]	± 5%
7	PST ∈ [0.5 ; 7]	± 5%	PST ∈ [0.5 ; 8]	± 5%
39	PST ∈ [0.5 ; 12]	± 5%	PST ∈ [0.5 ; 10]	± 5%
110	PST ∈ [0.5 ; 12]	± 5%	PST ∈ [0.5 ; 10]	± 5%
1620	PST ∈ [0.25 ; 12]	± 15%	PST ∈ [0.25 ; 10]	± 15%

Range of current and voltage ratios

Ratio	Minimum	Maximum
Voltage	$\dfrac{100}{1,000 \times \sqrt{3}}$	$\dfrac{9,999,900 \times \sqrt{3}}{0,1}$
Current [1]	1	60,000 / 1

(1) Only for the MN93A clamp (5 A), the 5 A adapter and the Essailec® adapter.

Measurement ranges after application of the ratios

Measurement		Measurement range	
		Minimum with minimum ratio(s)	Maximum with maximum ratio(s)
RMS & RMS ½ voltage	simple	120 mV	170 GV
	compound	120 mV	340 GV
Direct voltage (DC)	simple	120 mV	200 GV
	compound	120 mV	400 GV
Peak voltage (PK)	simple	160 mV	240 GV
	compound	320 mV	480 GV
RMS & RMS ½ current		5 mA	300 kA
Direct current (DC)		10 mA	5 kA
Peak current (PK)		7 mA	420 kA
Active power (P)		600 µW	51 PW [3]
DC power (Pdc)		1,2 mW	1 PW [3]
Reactive power (Q_1) non-active (N) and distortion power (D)		600 µvar	51 Pvar [3]
Apparent power (S)		600 µVA	51 PVA [3]
Active energy (Ph)		1 mWh	9 999 999 EWh [1]
DC energy (Pdch)		1 mWh	9 999 999 EWh [2]
Reactive energy (Q_1h) non-active (Nh) and distortion energy (Dh)		1 mvarh	9 999 999 Evarh [1]
Apparent energy (Sh)		1 mVAh	9 999 999 EVAh [1]

(1) The energy corresponds to more than 22,000 years of the associated maximum power (maximum ratios).
(2) The energy Pdch corresponds to more than 1 million years at maximum power Pdc (maximum ratios).
(3) Maximum value calculated for a 2-wire single-phase connection (phase-to-ground voltage).

15.3.5. CURRENT SENSOR CHARACTERISTICS (AFTER LINEARIZATION)

Sensor errors are offset by a typical correction inside the device. This typical correction, applied to the phase and amplitude, depends on the type of sensor connected (detected automatically) and the gain in the current acquisition channel used.

The RMS current measurement error and phase error are additional errors (which must therefore be added to the device errors), indicated as influences on the calculations carried out by the analyser (powers, energies, power factors, tangents, etc.).

Type of sensor	RMS current (A$_{RMS}$)	Maximum error for A$_{RMS}$	Maximum error for Φ

	[1 A ; 5 A]	± 0.5 %	±0°

Note: This table does not take into account possible distortion of the measured signal (THD) because of the physical limitations of the current sensor (saturation of the magnetic circuit or of the Hall-effect cell). Class B under standard IEC61000-4-30.

15.4. CLASS B UNDER STANDARD IEC 61000-4-30

15.4.1. CONFORMITY OF THE DEVICE

The device and its Power Analyzer Transfer 2 operating software are compliant with class B of standard IEC61000-4-30 for the following parameters:
- Industrial frequency,
- Supply voltage amplitude,
- Flicker,
- Supply voltage brownouts,
- Temporary overvoltages at industrial frequency,
- Supply voltage blackouts,
- Voltage transients,
- Supply voltage unbalance,
- Voltage harmonics.

Remark: To ensure this compliance, trend recordings (Trend mode) must be made with:
- A recording period of one second,
- The quantities Vrms and Urms selected,
- The quantities V-h01 and U-h01 selected.

15.4.2. UNCERTAINTIES AND MEASUREMENT RANGES

Parameter		Range	Uncertainty	U_{din}
Industrial frequency		[42,5 Hz ; 69 Hz]	±10 mHz	[50 V ; 1000 V]
Supply voltage amplitude		[50 V ; 1000 V]	±1 % of U_{din}	[50 V ; 1000 V]
Flicker		[0.25 ; 12]	See the corresponding tables	V ∈ {120 V ; 230 V} U ∈ {207 V ; 400 V}
Supply voltage brownouts	Residual voltage	[5 % of U_{din} ; U_{din}]	±2 % of U_{din}	[50 V ; 1000 V]
	Duration	[10 ms ; 65,535 days]	80 ppm ±10 ms (maximum) 30 ppm ±10 ms (typical)	
Temporary overvoltages at industrial frequency	Maximum amplitude	[U_{din} ; 150 % of U_{din}]	±2 % of U_{din}	[50 V ; 1000 V]
	Duration	[10 ms ; 65,535 days]	80 ppm ±10 ms (maximum) 30 ppm ±10 ms (typical)	
Supply voltage blackouts	Duration	[10 ms ; 65,535 days]	80 ppm ±10 ms (maximum) 30 ppm ±10 ms (typical)	[50 V ; 1000 V]
Supply voltage unbalance		[0 % ; 10 %]	±0.3 % or ±3 ct	[50 V ; 1000 V]
Voltage harmonics	Rate	[0 % ; 1500 %]	±(2.5 % + 5 ct)	[50 V ; 1000 V]
	Voltage	[2 V ; 1000 V]	±(2.5 % + 1 V)	

15.4.3. UNCERTAINTY OF THE REAL-TIME CLOCK

The uncertainty of the real-time clock is 80 ppm at most (device 3 years old used at an ambient temperature of 50°C). With a new device used at 25°C, this uncertainty is only 30 ppm.

16. APPENDICES

This section presents the mathematical formulae used in calculating various parameters.

16.1. MATHEMATICAL FORMULAE

16.1.1. NETWORK FREQUENCY AND SAMPLING

Sampling is controlled by (locked to) the network frequency so as to deliver 256 samples per cycle from 40 Hz to 70 Hz. This locking is essential for many calculations, including reactive power, distorting power, fundamental power factor, unbalance, and harmonic factors and angles.

The instantaneous frequency is measured by analysing eight consecutive positive-going zero crossings on the signal in question after digital low-pass filtering and digital suppression of the DC component (i.e. 7 periods filtered). The time of the zero crossing is determined precisely by linear interpolation between two samples.

The device is capable of calculating an instantaneous frequency simultaneously on each of the 3 phases in voltage (phase-to-neutral for distribution systems with neutral and phase-to-phase for distribution systems without neutral) or in current. It then chooses one from among two or three of them as the official instantaneous frequency.

The network frequency over one second is the harmonic mean of the instantaneous frequencies.

The signals are acquired using a 16-bit converter and (for current acquisition) dynamic gain switches.

16.1.2. WAVEFORM MODE

16.1.2.1. RMS values of half-cycle voltage and current (excluding neutral)

Half-cycle RMS phase-to-neutral voltage of phase (i+1) with $i \in [0; 2]$.

$$\text{Vdem}[i] = \sqrt{\frac{1}{NechDemPer} \cdot \sum_{n=Zéro}^{(Zéro\ suivant)-1} V[i][n]^2}$$

Half-cycle RMS phase-to-phase voltage of phase (i+1) with $i \in [0 ; 2]$.

$$\text{Udem}[i] = \sqrt{\frac{1}{NechDemPer} \cdot \sum_{n=Zéro}^{(Zéro\ suivant)-1} U[i][n]^2}$$

Half-cycle RMS current of phase (i+1) with $i \in [0 ; 2]$.

$$\text{Adem}[i] = \sqrt{\frac{1}{NechDemPer} \cdot \sum_{n=Zéro}^{(Zéro\ suivant)-1} A[i][n]^2}$$

Notes: these values are calculated for each half-cycle so as not to miss any fault.

NechDemPer is the number of samples in the half cycle.

16.1.2.2. Minimum and maximum half-cycle RMS values (excluding neutral)

Minimum and maximum RMS phase-to-neutral voltages of phase (i+1) with $i \in [0 ; 2]$.
Vmax [i] = max(Vdem[i]),   Vmin[i] = min(Vdem[i])

Minimum and maximum RMS phase-to-phase voltages of phase (i+1) with $i \in [0 ; 2]$.
Umax [i] = max(Udem[i]),   Umin[i] = min(Udem[i])

Minimum and maximum RMS currents of phase (i+1) with $i \in [0 ; 2]$.
Amax [i] = max(Adem[i]),   Amin[i] = min(Adem[i])

Note: The duration of the evaluation is left to the user's discretion (reset by pressing the ↵ key in the MAX-MIN mode).

16.1.2.3. DC quantities (neutral included except Udc – reassessment every second)

Phase-to-ground DC voltage of phase (i+1) with i ∈ [0; 3] (i = 3 ∈ neutral-ground voltage)

$$\mathrm{Vdc}[i] = \frac{1}{NechSec} \cdot \sum_{n=0}^{NechSec-1} V[i][n]$$

Phase-to-phase DC voltage of phase (i+1) with i ∈ [0 ; 2]

$$\mathrm{Udc}[i] = \frac{1}{NechSec} \cdot \sum_{n=0}^{NechSec-1} U[i][n]$$

DC current of phase (i+1) with i ∈ [0; 3] (i = 3 ∈ neutral current)

$$\mathrm{Adc}[i] = \frac{1}{NechSec} \cdot \sum_{n=0}^{NechSec-1} A[i][n]$$

Remark: The value NechSec is the number of samples per second.

16.1.2.4. Severity of Short-term flicker – 10 minutes (excluding neutral)

Method based on the IEC61000-4-15 standard.

The input values are half-period RMS voltages (phase-to-neutral for distribution systems with neutral, phase-to-phase for distribution systems without neutral). Blocks 3 and 4 are generated digitally. The classifier of block 5 has 128 levels.

The value of PST[i] is updated every 10 minutes (phase (i+1) with i ∈ [0; 2]).

Note: The user can reset the PST calculation by pressing the ↵ key in the ▱ Summary mode. It is important to note that the 10-minute intervals do not necessarily start on an integer multiple of 10 minutes of universal time coordinated (UTC).

16.1.2.5. Severity of LONG-term flicker – 2 hours (excluding neutral)

Method based on the IEC61000-4-15 standard.

$$PLT[i] = \sqrt[3]{\frac{\sum_{n=0}^{11} PST[i][n]^3}{12}}$$

The values of PST[i][n] are consecutive and 10 minutes apart. The value of PLT[i] (phase (i+1) with i ∈ [0; 2]) calculated in a two-hour window is updated either:
- every 10 minutes (Sliding long-term flicker – Configuration >Calculation methods >PLT)
- or every 2 hours (Non-sliding long-term flicker – Configuration >Calculation methods >PLT)

Note: The user can reset the PLT calculation by pressing the ↵ key in the ▱ Summary mode. It is important to note that the 2-hour intervals do not necessarily start on an integer multiple of 10 minutes (sliding PLT) or of 2 hours (non-sliding PLT) of universal time coordinated (UTC).

16.1.2.6. Peak values (neutral included except Upp and Upm – reassessment every second

Positive and negative phase-to-neutral peak voltages of phase (i+1) with i ∈ [0; 3] (i = 3 ⇔ neutral).
Vpp[i] = max(V[i][n]),   Vpm[i] = min(V[i][n])   n ∈ [0; N]

Positive and negative phase-to-phase peak voltages of phase (i+1) with i ∈ [0 ; 2].
Upp[i] = max(U[i][n]),   Upm[i] = min(U[i][n])   n ∈ [0 ; N]

Positive and negative peak currents of phase (i+1) with i ∈ [0; 3] (i = 3 ⇔ neutral).
App[i] = max(A[i][n]),   Apm[i] = min(A[i][n])   n ∈ [0; N]

Note: The duration of the evaluation is left to the user's discretion (reset by pressing the ↵ key in the ▱ MAX-MIN mode).

16.1.2.7. Peak factors (neutral included except Ucf – over one second)

Peak factor of phase-to-neutral voltage of phase (i+1) with i $\in$ [0; 3] (i = 3 $\Leftrightarrow$ neutral).

$$\text{Vcf}[i] = \frac{\max(|\text{Vpp}[i]|, |\text{Vpm}[i]|)}{\sqrt{\dfrac{1}{NechSec} \cdot \displaystyle\sum_{n=0}^{NechSec-1} V[i][n]^2}}$$

Peak factor of phase-to-phase voltage of phase (i+1) with i $\in$ [0 ; 2].

$$\text{Ucf}[i] = \frac{\max(|\text{Upp}[i]|, |\text{Upm}[i]|)}{\sqrt{\dfrac{1}{NechSec} \cdot \displaystyle\sum_{n=0}^{NechSec-1} U[i][n]^2}}$$

Peak factor of current of phase (i+1) with i $\in$ [0; 3] (i = 3 $\Leftrightarrow$ neutral).

$$\text{Acf}[i] = \frac{\max(|\text{App}[i]|, |\text{Apm}[i]|)}{\sqrt{\dfrac{1}{NechSec} \cdot \displaystyle\sum_{n=0}^{NechSec-1} A[i][n]^2}}$$

Note: NechSec is the number of samples in the second. The duration of evaluation of the peak values here is one second.

16.1.2.8. Rms values (neutral included except Urms – over one second)

RMS phase-to-neutral voltage of phase (i+1) with i $\in$ [0; 3] (i = 3 $\Leftrightarrow$ neutral).

$$\text{Vrms}[i] = \sqrt{\frac{1}{NechSec} \cdot \sum_{n=0}^{NechSec-1} V[i][n]^2}$$

RMS phase-to-phase voltage of phase (i+1) with i $\in$ [0 ; 2].

$$\text{Urms}[i] = \sqrt{\frac{1}{NechSec} \cdot \sum_{n=0}^{NechSec-1} U[i][n]^2}$$

RMS current of phase (i+1) with i $\in$ [0; 3] (i = 3 $\Leftrightarrow$ neutral).

$$\text{Arms}[i] = \sqrt{\frac{1}{NechSec} \cdot \sum_{n=0}^{NechSec-1} A[i][n]^2}$$

Note: NechSec is the number of samples in the second.

16.1.2.9. Negative-sequence unbalance rates (three-phase connection – over one second)

These are calculated from the filtered RMS vector values (over one second) VFrms[i] and AFrms[i] for distribution systems with neutral and UFrms[i] and AFrms[i] for distribution systems without neutral. (Ideally the fundamental vectors of the signals). The formulas used make use of Fortescue's symmetrical components from Fortescue's negative-sequence transformation.

Note: The operations are vector operations in complex notation with $\quad a = e^{j\frac{2\pi}{3}}$

Positive-sequence fundamental symmetrical phase-to-ground voltage (vector) in a distribution system with neutral

$$\text{Vrms}_+ = \frac{1}{3}\left(\text{VFrms}[0] + a \cdot \text{VFrms}[1] + a^2 \cdot \text{VFrms}[2]\right)$$

Negative-sequence fundamental symmetrical phase-to-ground voltage (vector) in a distribution system with neutral

$$\text{Vrms}_- = \frac{1}{3}\left(\text{VFrms}[0] + a^2 \cdot \text{VFrms}[1] + a \cdot \text{VFrms}[2]\right)$$

Negative-sequence unbalance factor of the phase-to-ground voltages in a distribution system with neutral

$$Vunb = \frac{|Vrms_-|}{|Vrms_+|}$$

Remark: The following quantities are saved with the negative-sequence unbalance factor in a trend recording: Vns = |Vrms-| and Vps = |Vrms+| (the norms of the negative-sequence and positive-sequence fundamental symmetrical components, respectively).

Positive-sequence phase-to-phase fundamental symmetrical voltage (vector) in a distribution system without neutral

$$Urms_+ = \frac{1}{3}(UFrms[0] + a \cdot UFrms[1] + a^2 \cdot UFrms[2])$$

Negative-sequence phase-to-phase fundamental symmetrical voltage (vector) in a distribution system without neutral

$$Urms_- = \frac{1}{3}(UFrms[0] + a^2 \cdot UFrms[1] + a \cdot UFrms[2])$$

Negative-sequence unbalance factor of the phase-to-phase voltages in a distribution system without neutral

$$Uunb = \frac{|Urms_-|}{|Urms_+|}$$

Remark: The following quantities are saved with the negative-sequence unbalance factor in a trend recording: Uns = |Urms-| and Ups = |Urms+| (the norms of the negative-sequence and positive-sequence fundamental symmetrical components, respectively).

Positive-sequence fundamental symmetrical current (vector)

$$Arms_+ = \frac{1}{3}(AFrms[0] + a \cdot AFrms[1] + a^2 \cdot AFrms[2])$$

Reverse-sequence fundamental symmetrical current (vector)

$$Arms_- = \frac{1}{3}(AFrms[0] + a^2 \cdot AFrms[1] + a \cdot AFrms[2])$$

Negative-sequence unbalance rate of the current

$$Aunb = \frac{|Arms_-|}{|Arms_+|}$$

Remark: The following quantities are saved with the negative-sequence unbalance factor in a trend recording: Ans = |Arms-| and Aps = |Arms+| (the norms of the negative-sequence and positive-sequence fundamental symmetrical components, respectively).

16.1.2.10. Fundamental rms values (excluding neutral – over one second)

These are calculated from the filtered vector (instantaneous) values. A digital filter made up of 6 low-pass order 2 infinite pulse response Butterworth filters and one high-pass order 2 infinite pulse response Butterworth filter is used to extract the fundamental components.

16.1.2.11. Fundamental angular values (excluding neutral – over one second)

These are calculated from the filtered vector (instantaneous) values. A digital filter made up of 6 low-pass order 2 infinite pulse response Butterworth filters and one high-pass order 2 infinite pulse response Butterworth filter is used to extract the fundamental components. The angular values calculated are those between:
- 2 phase-to-neutral voltages
- 2 line currents
- 2 phase-to-phase voltages
- One phase-to-neutral voltage and one line current (distribution systems with neutral)
- One phase-to-phase voltage and one line current (2-wire two-phase distribution systems)

16.1.3. HARMONIC MODE

16.1.3.1. FFT (neutral included except for Uharm and VAharm – over 4 consecutive periods every second)

These calculations are carried out by FFT (16 bits), 1024 points over four cycles, with a rectangular window (see IEC61000-4-7). From the real parts b_k and the imaginary parts a_k, the harmonic factor is calculated for each order (j) and for each phase (i) Vharm[i][j], Uharm[i][j] and Aharm[i][j] with respect to the fundamental and the angles Vph[i][j], Uph[i][j] and Aph[i][j] with respect to the fundamental. For the neutral-earth voltage and the neutral current, the level of harmonics is calculated for each order (j) Vharm[3][j] and Aharm[3][j] with respect to the total RMS value (AC+DC) of the complete signal (the harmonic angles are not calculated).

Note: The calculations are performed sequentially: {V1; A1} then {V2; A2} then {V3; A3} then {UN ; AN} then {U1; U2} and finally {U3}. In the case of a 2-wire two-phase distribution source, the couple {V1; A1} is replaced by the couple {U1; A1}.

The level in % with respect to the fundamental [% f] $\Leftrightarrow$ $\tau_k = \dfrac{c_k}{c_4} 100$

The level in % with respect to the total RMS value [% r] $\Leftrightarrow$ $\tau_k = \dfrac{c_k}{\sqrt{\displaystyle\sum_{m=0}^{50} C_{4m}^2}} 100$

The angle with respect to the fundamental in degrees [°] $\Leftrightarrow$ $\varphi_k = \arctan\left(\dfrac{a_k}{b_k}\right) - \varphi_4$

with
$$
\begin{cases}
c_k = |b_k + \dot{\mu}_k| = \sqrt{a_k^2 + b_k^2} \\[2mm]
b_k = \dfrac{1}{512} \displaystyle\sum_{s=0}^{1024} F_s \cdot \sin\left(\dfrac{k\pi}{512} s + \varphi_k\right) \\[2mm]
a_k = \dfrac{1}{512} \displaystyle\sum_{s=0}^{1024} F_s \cdot \cos\left(\dfrac{k\pi}{512} s + \varphi_k\right) \\[2mm]
c_0 = \dfrac{1}{1024} \displaystyle\sum_{s=0}^{1024} F_s
\end{cases}
$$

c_k is the amplitude of the component of order $m = \dfrac{k}{4}$ with a frequency $f_k = \dfrac{k}{4} f_4$.

F_s is the sampled signal at the fundamental frequency f_4.

c_0 is the DC component.

k   is the index of the spectral spike (the order of the harmonic component is $m = \dfrac{k}{4}$).

Note: The power harmonic factors are calculated by multiplying the phase-to-neutral voltage harmonic factors by the current harmonic factors. The power harmonic angles (VAharm[i][j] and VAph[i][j]) are calculated by differentiating the phase-to-neutral voltage harmonic angles with the current harmonic angles. In the case of a 2-wire two-phase distribution source, the phase-to-neutral voltage V1 is replaced by the phase-to-phase voltage U1 and one obtains the harmonic power levels UAharm[0][j] and the harmonic power angles UAph[0][j].

16.1.3.2. Harmonic distortions

Two global values giving the relative quantity of the harmonic are calculated:
- the THD as a proportion of the fundamental (also noted THD-F),
- the THD as a proportion of the total RMS-AC value (also noted THD-R).

Total harmonic distortion of phase (i+1) with i $\in$ [0; 2] (THD-F)

$$
\text{Vthdf}[i] = \frac{\sqrt{\displaystyle\sum_{n=2}^{50} Vharm[i][n]^2}}{Vharm[i][1]}, \quad \text{Uthdf}[i] = \frac{\sqrt{\displaystyle\sum_{n=2}^{50} Uharm[i][n]^2}}{Uharm[i][1]}, \quad \text{Athdf}[i] = \frac{\sqrt{\displaystyle\sum_{n=2}^{50} Aharm[i][n]^2}}{Aharm[i][1]}
$$

Total harmonic distortion of channel (i+1) with i ∈ [0; 3] (THD-R).

$$Vthdr[i] = \sqrt{\dfrac{\sum\limits_{n=2}^{50} Vharm[i][n]^2}{\sum\limits_{n=1}^{50} Vharm[i][n]^2}} \;,\; Uthdr[i] = \sqrt{\dfrac{\sum\limits_{n=2}^{50} Uharm[i][n]^2}{\sum\limits_{n=1}^{50} Uharm[i][n]^2}} \;,\; Athdr[i] = \sqrt{\dfrac{\sum\limits_{n=2}^{50} Aharm[i][n]^2}{\sum\limits_{n=1}^{50} Aharm[i][n]^2}}$$

The THD as a proportion of the RMS-AC value (THD-R) is also called the distortion factor (DF).

16.1.3.3. Harmonic loss factor (without neutral – over 4 consecutive periods every second)

Harmonic loss factor of the phase (i+1) with i ∈ [0; 2]

$$FHL[i] = \dfrac{\sum\limits_{n=1}^{n=50} n^2 \cdot Aharm[i][n]^2}{\sum\limits_{n=1}^{n=50} Aharm[i][n]^2}$$

16.1.3.4. K factor (excluding neutral – over 4 consecutive cycles every second)

K factor for phase (i+1) with i ∈ [0; 2], e ∈ [0.05; 0.1] and q ∈ [1.5; 1.7]

$$FK[i] = \sqrt{1 + \dfrac{e}{1+e} \cdot \dfrac{\sum\limits_{n=2}^{n=50} n^q \cdot Aharm[i][n]^2}{\sum\limits_{n=1}^{n=50} Aharm[i][n]^2}}$$

16.1.3.5. Sequence harmonics (over 3 × (4 consecutive cycles) every second)

Negative-sequence harmonics

$$Aharm_- = \dfrac{1}{3} \sum\limits_{i=0}^{2} \dfrac{\sum\limits_{j=0}^{7} Aharm[i][3j+2]}{Aharm[i][1]}$$

Three-phase systems with neutral

$$Vharm_- = \dfrac{1}{3} \sum\limits_{i=0}^{2} \dfrac{\sum\limits_{j=0}^{7} Vharm[i][3j+2]}{Vharm[i][1]}$$

Three-phase systems without neutral

$$Uharm_- = \dfrac{1}{3} \sum\limits_{i=0}^{2} \dfrac{\sum\limits_{j=0}^{7} Uharm[i][3j+2]}{Uharm[i][1]}$$

Zero-sequence harmonics

$$Aharm_0 = \dfrac{1}{3} \sum\limits_{i=0}^{2} \dfrac{\sum\limits_{j=0}^{7} Aharm[i][3j+3]}{Aharm[i][1]}$$

Three-phase systems with neutral

$$Vharm_0 = \frac{1}{3}\sum_{i=0}^{2}\frac{\sum_{j=0}^{7}Vharm[i][3j+3]}{Vharm[i][1]}$$

Three-phase systems without neutral

$$Uharm_0 = \frac{1}{3}\sum_{i=0}^{2}\frac{\sum_{j=0}^{7}Uharm[i][3j+3]}{Uharm[i][1]}$$

Positive -sequence harmonics

$$Aharm_+ = \frac{1}{3}\sum_{i=0}^{2}\frac{\sum_{j=0}^{7}Aharm[i][3j+4]}{Aharm[i][1]}$$

Three-phase systems with neutral

$$Vharm_+ = \frac{1}{3}\sum_{i=0}^{2}\frac{\sum_{j=0}^{7}Vharm[i][3j+4]}{Vharm[i][1]}$$

Three-phase systems without neutral

$$Uharm_+ = \frac{1}{3}\sum_{i=0}^{2}\frac{\sum_{j=0}^{7}Uharm[i][3j+4]}{Uharm[i][1]}$$

16.1.4. POWER

Powers without neutral – over one second

16.1.4.1. Distribution system with neutral

Active power of phase (i+1) with i $\in$ [0; 2].

$$P[i] = W[i] = \frac{1}{NechSec} \cdot \sum_{n=0}^{NechSec-1} V[i][n] \cdot A[i][n]$$

DC power of phase (i+1) with i $\in$ [0 ; 2].
Pdc[i] = Wdc[i] = Vdc[i]. Adc[i]

Apparent power of phase (i+1) with i $\in$ [0; 2].
S[i] = VA[i] = Vrms[i]. Armsi]

Reactive power of phase (i+1) with i $\in$ [0; 2] (Non-active quantities broken down).

$$Q_1[i] = VARF[i] = \frac{1}{NechSec} \cdot \sum_{n=0}^{NechSec-1} VF[i][n - \frac{NechPer}{4}] \cdot AF[i][n]$$

Distortion power of the phase (i+1) with i $\in$ [0; 2] (Non-active quantities broken down).

$$D[i] = V\overline{A}D[i] = \sqrt{S[i]^2 - P[i]^2 - Q_1[i]^2}$$

Non-active power of phase (i+1) with i $\in$ [0;2] (Non-active quantities broken down).

$$N[i] = VAR[i] = \sqrt{S[i]^2 - P[i]^2}$$

Total active power
P[3] = W[3] = P[0] + P[1] + P[2]

Total DC power
Pdc[3] = Wdc[3] = Pdc[0] + Pdc[1] + Pdc[2]

Total apparent power
S[3] = VA[3] = S[0] + S[1] + S[2]

Total reactive power (Non-active quantities broken down)
$Q_1[3] = VARF[3] = Q_1[0] + Q_1[1] + Q_1[2]$

Total distortion power (Non-active quantities broken down)

$$D[3] = VAD[3] = \sqrt{S[3]^2 - P[3]^2 - Q_1[3]^2}$$

Total non-active power (Non-active quantities non broken down)

$$N[3] = VAR[3] = \sqrt{S[3]^2 - P[3]^2}$$

16.1.4.2. Three-phase system with virtual neutral

Three-phase distribution systems without neutral are considered as a whole (no phase-by-phase power calculation). The device therefore displays only the total quantities.

The three-wattmeter method with virtual neutral is applied for the calculation of the total active power, of the total reactive power and of the total DC power.

Total active power.

$$P[3] = W[3] = \sum_{i=0}^{2} \left(\frac{1}{NechSec} \sum_{n=0}^{NechSec-1} V[i][n].A[i][n] \right)$$

Total DC power.

$$Pdc[3] = Wdc[3] = \sum_{i=0}^{2} (Vdc[i].Adc[i])$$

Total apparent power.

$$S[3] = VA[3] = \frac{1}{\sqrt{3}} \sqrt{(Urms^2[0] + Urms^2[1] + Urms^2[2])} \sqrt{(Arms^2[0] + Arms^2[1] + Arms^2[2])}$$

Note: This is the RMS total apparent power as defined in IEEE 1459-2010 for distribution systems without neutral.

Total reactive power (Non-active quantities broken down – Configuration > Methods of calculation > var)

$$Q_1[3] = VARF[3] = \sum_{i=0}^{2} \left(\frac{1}{NechSec} \sum_{n=0}^{NechSec-1} VF[i] \left[n - \frac{NechPer}{4} \right] . AF[i][n] \right)$$

Total distortion power (Non-active quantities broken down – Configuration > Methods of calculation > var)

$$D[3] = VAD[3] = \sqrt{(S[3]^2 - P[3]^2 - Q_1[3]^2)}$$

Total non-active power (Non-active quantities not broken down – Configuration > Methods of calculation > var)

$$N[3] = VAR[3] = \sqrt{(S[3]^2 - P[3]^2)}$$

16.1.4.3. Three-phase system without neutral

Three-phase distribution systems without neutral are considered as a whole (no phase-by-phase power calculation). The device therefore displays only the total quantities.

The two-wattmeter method (Aron method or two-element method) is applied for the calculation of the total active power, of the total reactive power and of the total DC power.

a) Reference in L1
Active power, Wattmeter 1

Non-active power (Non-active quantities not broken down – Configuration >Calculation methods >VAR)

$$N[0] = AR[0] = \sqrt{S[0]^2 - P[0]^2}$$

16.1.5. POWER RATIOS (EXCLUDING NEUTRAL – OVER ONE SECOND)

a) Distribution system with neutral

Power Factor of phase (i+1) with i $\in$ [0; 2].

$$PF[i] = \frac{P[i]}{S[i]}$$

Fundamental power factor of phase (i+1) or cosine of the angle of the phase-to-neutral voltage fundamental of phase (i+1) with respect to the current fundamental of phase (i+1) with i $\in$ [0; 2]

$$DPF[i] = \cos(\phi[i]) = \frac{\sum_{n=0}^{NechSec-1} VF[i][n] \cdot AF[i][n]}{\sqrt{\sum_{n=0}^{NechSec-1} VF[i][n]^2} \cdot \sqrt{\sum_{n=0}^{NechSec-1} AF[i][n]^2}}$$

Note: The fundamental power factor is also called the displacement factor.

Tangent of phase (i+1) or tangent of the angle of the phase-to-neutral voltage fundamental of phase (i+1) with respect to the current fundamental of phase (i+1) with i $\in$ [0; 2]

$$Tan[i] = \tan(\phi[i]) = \frac{\sum_{n=0}^{NechSec-1} VF[i][n - \frac{NechPer}{4}] \cdot AF[i][n]}{\sum_{n=0}^{NechSec-1} VF[i][n] \cdot AF[i][n]}$$

Total power factor

$$PF[3] = \frac{P[3]}{S[3]}$$

Total fundamental power factor

$$DPF[3] = \frac{P_1[3]}{\sqrt{P_1[3]^2 + Q_1[3]^2}}$$

With:

$$P_1[3] = \sum_{n=0}^{NechSec-1} VF[0][n] \cdot AF[0][n] + \sum_{n=0}^{NechSec-1} VF[1][n] \cdot AF[1][n] + \sum_{n=0}^{NechSec-1} VF[2][n] \cdot AF[2][n]$$

$$Q_1[3] = \sum_{n=0}^{NechSec-1} VF[0][n - \frac{NechPer}{4}] \cdot AF[0][n] + \sum_{n=0}^{NechSec-1} VF[1][n - \frac{NechPer}{4}] \cdot AF[1][n] + \sum_{n=0}^{NechSec-1} VF[2][n - \frac{NechPer}{4}] \cdot AF[2][n]$$

Note: The fundamental power factor is also called the displacement factor.

Total tangent

$$Tan[3] = \frac{Q_1[3]}{P_1[3]}$$

b) Distribution system with virtual neutral

Total power factor.

$$PF[3] = \frac{P[3]}{S[3]}$$

Total fundamental power factor.

$$DPF[3] = \frac{P_1[3]}{\sqrt{(P_1[3]^2 + Q_1[3]^2)}}$$

With:

$$P_1[3] = \sum_{i=0}^{2} \left(\sum_{n=0}^{NechSec-1} VF[i][n].AF[i][n] \right)$$

$$Q_1[3] = \sum_{i=0}^{2} \left(\sum_{n=0}^{NechSec-1} VF[i]\left[n - \frac{NechPer}{4} \right] . AF[i][n] \right)$$

Note: The fundamental power factor is also called the displacement factor.

Total tangent

$$Tan[3] = \frac{Q_1[3]}{QP_1[3]}$$

c) Three-phase system without neutral

Total power factor

$$PF[3] = \frac{P[3]}{S[3]}$$

Total fundamental power factor

$$DPF[3] = \frac{P_1[3]}{\sqrt{P_1[3]^2 + Q_1[3]^2}}$$

With :
If reference on L1

$$P_1[3] = \frac{1}{NechSec} \cdot \sum_{n=0}^{NechSec-1} U[2][n] \cdot A[2][n] + \frac{1}{NechSec} \cdot \sum_{n=0}^{NechSec-1} -U[0][n] \cdot A[1][n]$$

If reference on L2

$$P_1[3] = \frac{1}{NechSec} \cdot \sum_{n=0}^{NechSec-1} U[0][n] \cdot A[0][n] + \frac{1}{NechSec} \cdot \sum_{n=0}^{NechSec-1} -U[1][n] \cdot A[2][n]$$

If reference on L3

$$P_1[3] = \frac{1}{NechSec} \cdot \sum_{n=0}^{NechSec-1} -U[2][n] \cdot A[0][n] + \frac{1}{NechSec} \cdot \sum_{n=0}^{NechSec-1} U[1][n] \cdot A[1][n]$$

Note: The fundamental power factor is also called the displacement factor.

Total tangent

$$Tan[3] = \frac{Q_1[3]}{P_1[3]}$$

d) Two-phase system without neutral

Two-phase distribution systems without neutral (2-wire two-phase) are treated as single-phase distribution system having their voltage reference on L2 rather than N (neutral).

Power factor

$$PF[0] = \frac{P[0]}{S[0]}$$

Fundamental power factor

$$DPF[0] = \frac{P_1[0]}{\sqrt{P_1[0]^2 + Q_1[0]^2}}$$

With:

$$P_1[0] = \frac{1}{NechSec} \cdot \sum_{n=0}^{NechSec-1} UF[0][n] \cdot AF[0][n]$$

Note: The fundamental power factor is also called the displacement factor.

Tangent

$$Tan[0] = \frac{Q_1[0]}{P_1[0]}$$

16.1.6. ENERGIES

Energies excluding neutral – over Tint with refresh every second

16.1.6.1. Distribution system with neutral

Note: Tint is the power integration time in energy calculations; the beginning and end of this period are user-controlled.

Consumed DC energy of phase (i+1) with i ∈ [0; 2]

$$\mathrm{Pdch}[0][i] = \mathrm{Wdch}[0][i] = \sum_{n}^{T_{\text{int}}} \frac{Pdc[i][n]}{3600}$$ with Pdc[i][n] ≥ 0

Total consumed DC energy
Pdch[0][3] = Wdch[0][3] = Pdch[0][0] + Pdch[0][1] + Pdch[0][2]

a) Energies consumed other than DC (P[i][n] ≥ 0)
Consumed active energy of phase (i+1) with i ∈ [0; 2].

$$\mathrm{Ph}[0][i] = \mathrm{Wh}[0][i] = \sum_{n}^{T_{\text{int}}} \frac{P[i][n]}{3600}$$

Consumed apparent energy of phase (i+1) with i ∈ [0; 2].

$$\mathrm{Sh}[0][i] = \mathrm{VAh}[0][i] = \sum_{n}^{T_{\text{int}}} \frac{S[i][n]}{3600}$$

Consumed inductive reactive energy of phase (i+1) with i ∈ [0; 2].
(Non-active quantities broken down – Configuration >Calculation methods >VAR)

$$Q_1\mathrm{hL}[0][i] = \mathrm{VARhL}[0][i] = \sum_{n}^{T_{\text{int}}} \frac{Q_1[i][n]}{3600}$$ with Q₁[i][n] ≥ 0

Consumed capacitive reactive energy of phase (i+1) with i ∈ [0; 2].
(Non-active quantities broken down – Configuration >Calculation methods >VAR)

$$Q_1\mathrm{hC}[0][i] = \mathrm{VARhC}[0][i] = \sum_{n}^{T_{\text{int}}} \frac{-Q_1[i][n]}{3600}$$ with Q₁[i][n] < 0

Consumed distortion energy of phase (i+1) with i ∈ [0; 2]
(Non-active quantities broken down – Configuration >Calculation methods >VAR)

$$\mathrm{Dh}[0][i] = \mathrm{VADh}[0][i] = \sum_{n}^{T_{\text{int}}} \frac{D[i][n]}{3600}$$

Consumed non-active energy of phase (i+1) with i ∈ [0; 2]
(Non-active quantities not broken down – Configuration >Calculation methods >VAR)

$$\mathrm{Nh}[0][i] = \mathrm{VARh}[0][i] = \sum_{n}^{T_{\text{int}}} \frac{N[i][n]}{3600}$$

Total consumed active energy
Ph[0][3] = Wh[0][3] = Ph[0][0] + Ph[0][1] + Ph[0][2]

Total consumed apparent energy
Sh[0][3] = VAh[0][3] = Sh[0][0] + Sh[0][1] + Sh[0][2]

Total consumed reactive inductive energy
(Non-active quantities broken down – Configuration >Calculation methods >VAR)
Q₁hL[0][3] = VARhL[0][3] = Q₁hL[0][0] + Q₁hL[0][1] + Q₁hL[0][2]

Total consumed capacitive reactive energy
(Non-active quantities broken down – Configuration >Calculation methods >VAR)
$Q_1C[0][3] = VARhC[0][3] = Q_1C[0][0] + Q_1C[0][1] + Q_1C[0][2]$

Total consumed distortion energy
(Non-active quantities broken down – Configuration >Calculation methods >VAR)
$Dh[0][3] = VADh[0][3] = Dh[0][0] + Dh[0][1] + Dh[0][2]$

Total consumed non-active energy
(Non-active quantities not broken down – Configuration >Calculation methods >VAR)
$Nh[0][3] = VARh[0][3] = Nh[0][0] + Nh[0][1] + Nh[0][2]$

b) Generated DC energy of phase (i+1) with i $\in$ [0; 2]

$$Pdch[1][i] = Wdch[1][i] = \sum_n^{T_{int}} \frac{-Pdc[i][n]}{3600}$$ with Pdc[i][n] < 0

c) Total generated DC energy
$Pdch[1][3] = Wdch[1][3] = Pdch[1][0] + Pdch[1][1] + Pdch[1][2]$

d) Energies generated other than DC (P[i][n] < 0)
Generated active energy of phase (i+1) with i $\in$ [0; 2].

$$Ph[1][i] = Wh[1][i] = \sum_n^{T_{int}} \frac{-P[i][n]}{3600}$$

Generated apparent energy of phase (i+1) with i $\in$ [0; 2].

$$Sh[1][i] = VAh[1][i] = \sum_n^{T_{int}} \frac{S[i][n]}{3600}$$

Generated inductive reactive energy of phase (i+1) with i $\in$ [0; 2].
(Non-active quantities broken down – Configuration >Calculation methods >VAR)

$$Q_1hL[1][i] = VARhL[1][i] = \sum_n^{T_{int}} \frac{-Q_1[i][n]}{3600}$$ with Q_1[i][n] < 0

Generated capacitive reactive energy of phase (i+1) with i $\in$ [0; 2].
(Non-active quantities broken down – Configuration >Calculation methods >VAR)

$$Q_1hC[1][i] = VARhC[1][i] = \sum_n^{T_{int}} \frac{Q_1[i][n]}{3600}$$ with Q_1[i][n] $\geq$ 0

Generated distortion energy of phase (i+1) with i $\in$ [0; 2]
(Non-active quantities broken down – Configuration >Calculation methods >VAR)

$$Dh[1][i] = VADh[1][i] = \sum_n^{T_{int}} \frac{D[i][n]}{3600}$$

Generated non-active energy of phase (i+1) with i $\in$ [0; 2]
(Non-active quantities not broken down – Configuration >Calculation methods >VAR)

$$Nh[1][i] = VARh[1][i] = \sum_n^{T_{int}} \frac{N[i][n]}{3600}$$

Total generated active energy
$Ph[1][3] = Wh[1][3] = Ph[1][0] + Ph[1][1] + Ph[1][2]$

Total generated apparent energy
$Sh[1][3] = VAh[1][3] = Sh[1][0] + Sh[1][1] + Sh[1][2]$

Total generated inductive reactive energy
(Non-active quantities broken down – Configuration >Calculation methods >VAR)
$Q_1hL[1][3] = VARhL[1][3] = Q_1hL[1][0] + Q_1hL[1][1] + Q_1hL[1][2]$

Total generated capacitive reactive energy
(Non-active quantities broken down – Configuration >Calculation methods >VAR)
$Q_1hC[1][3] = VARhC[1][3] = Q_1hC[1][0] + Q_1hC[1][1] + Q_1hC[1][2]$

Total generated distortion energy
(Non-active quantities broken down – Configuration >Calculation methods >VAR)
$Dh[1][3] = VADh[1][3] = Dh[1][0] + Dh[1][1] + Dh[1][2]$

Total generated non-active energy
(Non-active quantities not broken down – Configuration >Calculation methods >VAR)
$Nh[1][3] = VARh[1][3] = Nh[1][0] + Nh[1][1] + Nh[1][2]$

16.1.6.2. Distribution system with virtual neutral or without neutral

We speak here only of total energies, with:
- Three-phase systems without neutral or with virtual neutral: i = 3
- Two-phase system without neutral: i = 3 or i = 0 (this is the same thing - see remark below)

Note: Two-phase distribution systems without neutral (2-wire two-phase) are treated as single-phase distribution system having their voltage reference on L2 rather than N (neutral).

Total consumed DC energy

$$\mathrm{Pdch}[0][i] = \mathrm{Wdch}[0][i] = \sum_n^{T_{int}} \frac{Pdc[i][n]}{3600}$$ with Pdc[i][n] ≥ 0

a) Total energies consumed other than DC (P[i][n] ≥ 0)
Total consumed active energy

$$\mathrm{Ph}[0][i] = \mathrm{Wh}[0][i] = \sum_n^{T_{int}} \frac{P[i][n]}{3600}$$

Total consumed apparent energy

$$\mathrm{Sh}[0][i] = \mathrm{VAh}[0][i] = \sum_n^{T_{int}} \frac{S[i][n]}{3600}$$

Total consumed inductive reactive energy
(Non-active quantities broken down – Configuration >Calculation methods >VAR)

$$Q_1\mathrm{hL}[0][i] = \mathrm{VARhL}[0][i] = \sum_n^{T_{int}} \frac{Q_1[i][n]}{3600}$$ with Q1[i][n] ≥ 0

Total consumed capacitive reactive energy
(Non-active quantities broken down – Configuration >Calculation methods >VAR)

$$Q_1\overline{\mathrm{h}}\mathrm{C}[0][i] = \mathrm{VARhC}[0][i] = \sum_n^{T_{int}} \frac{-Q_1[i][n]}{3600}$$ with Q1[i][n] < 0

Total consumed distortion energy
(Non-active quantities broken down – Configuration >Calculation methods >VAR)

$$\mathrm{Dh}[0][i] = \mathrm{VADh}[0][i] = \sum_n^{T_{int}} \frac{D[i][n]}{3600}$$

Total consumed non-active energy
(Non-active quantities not broken down – Configuration >Calculation methods >VAR)

$$\mathrm{Nh}\left[0\right]\!\left[i\right] = \mathrm{VARh}\left[0\right]\!\left[i\right] = \sum_{n}^{T_{\mathrm{int}}} \frac{N\left[i\right]\!\left[n\right]}{3600}$$

b) Total generated DC energy

$$\mathrm{Pdch}\left[1\right]\!\left[i\right] = \mathrm{Wdch}\left[1\right]\!\left[i\right] = \sum_{n}^{T_{\mathrm{int}}} \frac{-Pdc\left[i\right]\!\left[n\right]}{3600} \quad \text{with Pdc[i][n] < 0}$$

c) Total energies generated other than DC (P[i][n] < 0)
Total generated active energy

$$\mathrm{Ph}\left[1\right]\!\left[i\right] = \mathrm{Wh}\left[1\right]\!\left[i\right] = \sum_{n}^{T_{\mathrm{int}}} \frac{-P\left[i\right]\!\left[n\right]}{3600}$$

Total generated apparent energy

$$\mathrm{Sh}\left[1\right]\!\left[i\right] = \mathrm{VAh}\left[1\right]\!\left[i\right] = \sum_{n}^{T_{\mathrm{int}}} \frac{S\left[i\right]\!\left[n\right]}{3600}$$

Total generated inductive reactive energy
(Non-active quantities broken down – Configuration >Calculation methods >VAR)

$$\mathrm{Q_1hL}\left[1\right]\!\left[i\right] = \mathrm{VARhL}\left[1\right]\!\left[i\right] = \sum_{n}^{T_{\mathrm{int}}} \frac{-Q_1\left[i\right]\!\left[n\right]}{3600} \quad \text{with } Q_1\text{[i][n] < 0}$$

Total generated capacitive reactive energy
(Non-active quantities broken down – Configuration >Calculation methods >VAR)

$$\mathrm{Q_1hC}\left[1\right]\!\left[i\right] = \mathrm{VARhC}\left[1\right]\!\left[i\right] = \sum_{n}^{T_{\mathrm{int}}} \frac{Q_1\left[i\right]\!\left[n\right]}{3600} \quad \text{with } Q_1\text{[i][n] } \geq 0$$

Total generated distortion energy
(Non-active quantities broken down – Configuration >Calculation methods >VAR)

$$\mathrm{Dh}\left[1\right]\!\left[i\right] = \mathrm{VADh}\left[1\right]\!\left[i\right] = \sum_{n}^{T_{\mathrm{int}}} \frac{D\left[i\right]\!\left[n\right]}{3600}$$

Total generated non-active energy
(Non-active quantities not broken down – Configuration >Calculation methods >VAR)

$$\mathrm{Nh}\left[1\right]\!\left[i\right] = \mathrm{VARh}\left[1\right]\!\left[i\right] = \sum_{n}^{T_{\mathrm{int}}} \frac{N\left[i\right]\!\left[n\right]}{3600}$$

16.2. DISTRIBUTION SOURCES SUPPORTED BY THE DEVICE

See connections in §4.6.

16.3. HYSTERESIS

Hysteresis is a screening principle that is often used after detection of a threshold stage in △ Alarm mode (see §4.10) and in Inrush current mode (see §5.2). A correct hysteresis setting avoids repeated changes of state when the measurement oscillates about the threshold.

16.3.1. SURGE DETECTION

With a hysteresis of 2%, for example, the return level for surge detection is equal to (100% - 2%) or 98% of the voltage threshold.
16.3.2. BROWNOUT OR BLACKOUT DETECTION

With a hysteresis of 2%, for example, the return level for brownout detection is equal to (100% + 2%), or 102% of the voltage threshold.
16.4. MINIMUM SCALE VALUES FOR WAVEFORMS AND MINIMUM RMS VALUES

	Minimum scale value (waveform mode)	Minimum RMS values
Phase-to-neutral and phase-to-phase voltages	8 V [1]	2 V [1]
AmpFLEX™ A193 (6500 A and 10 kA)	90 A	10 A
MiniFLEX MA193 (6500 A et 10 kA)	90 A	10 A
AmpFLEX™ A193 (100 A)	800 mA	100 mA
MiniFLEX MA193 (100 A)	800 mA	100 mA
J93 clamp	30 A	3 A
C193 clamp	8 A	1 A
PAC93 clamp	8 A	1 A
MN93 clamp	2 A	200 mA
MN93A clamp (100 A)	800 mA	100 mA
E3N clamp (10 mV/A)	800 mA	100 mA
E3N clamp (100 mV/A)	80 mA	10 mA
MN93A clamp (5 A)	40 mA [1]	5 mA [1]
5 A and Essailec® adapter	40 mA [1]	5 mA [1]

(1)   Value to be multiplied by the ratio in effect (if not unity).

16.5. FOUR-QUADRANT DIAGRAM

This diagram is used for �W power and energy measurements (see §9).
Figure 123: Four-quadrant diagram

16.6. MECHANISM FOR TRIGGERING TRANSIENT CAPTURES

The sampling rate is a constant 256 samples per cycle. When a transient capture is started, each sample is compared to the sample from the preceding cycle. The preceding cycle defines the mid-point of a virtual tube and is used as reference. As soon as a sample is outside the envelope, it is treated as a triggering event; the representation of the transient is then captured by the device. The cycle preceding the event and the three following cycles are saved to memory.

Here is a graphic representation of the transient capture triggering mechanism:
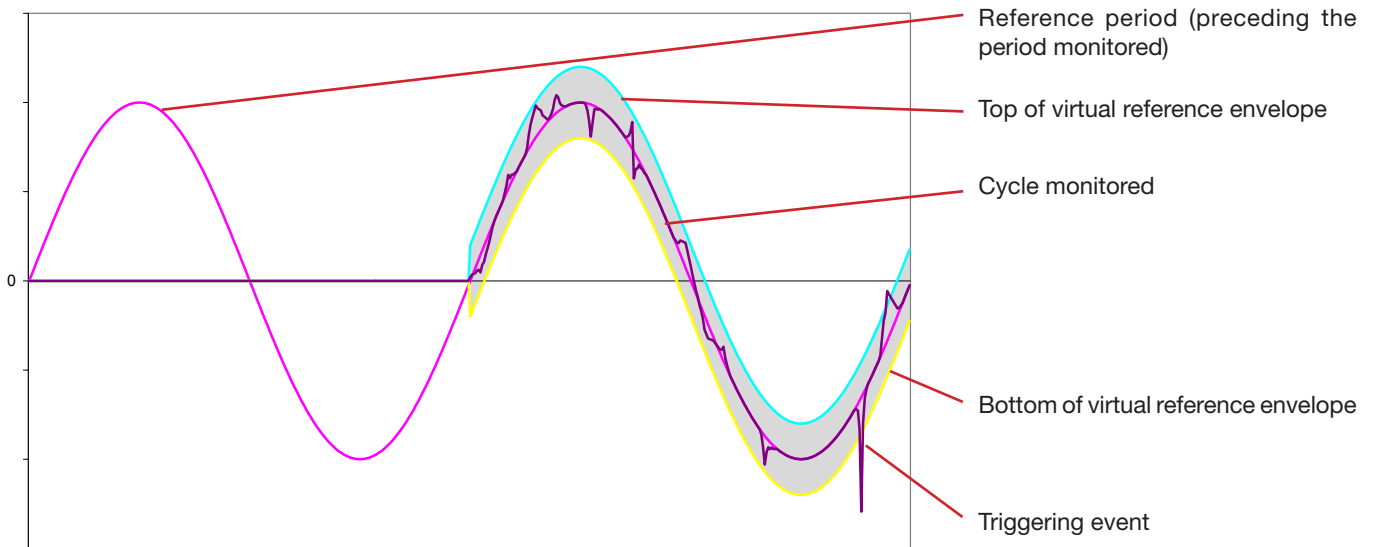

The half-width of the virtual envelope for the voltage and current is equal to the threshold programmed in the Transient mode of the configuration (see §4.8).

16.7. CAPTURE CONDITIONS IN INRUSH CURRENT MODE

The capture depends on a triggering (start) event and a stop event. If a capture ends with a stop event or if the recording memory of the device is full, the capture stops automatically.

The capture stop threshold is calculated as follows:
[Stop threshold [A]] = [Start threshold [A]] × (100 – [stop hysteresis [%]]) ÷ 100

Here are the conditions for triggering and stopping captures:

Triggering filter	Triggering and stop conditions
A1	Triggering condition ⇔ [A1 half-cycle RMS value] > [Triggering threshold] Stop condition ⇔ [A1 half-cycle RMS value] < [Stop threshold]
A2	Triggering condition ⇔ [A2 half-cycle RMS value] > [Triggering threshold] Stop condition ⇔ [A2 half-cycle RMS value] < [Stop threshold]
A3	Triggering condition ⇔ [A3 half-cycle RMS value] > [Triggering threshold] Stop condition ⇔[A3 half-cycle RMS value] < [Stop threshold]
3A	Triggering condition ⇔ [[the half-cycle RMS value of one current channel]> [Triggering threshold] Stop condition ⇔ [the half-cycle RMS values of all current channels] < [Stop threshold]

16.8. GLOSSARY

≃	AC and DC components.
∼	AC component only.
═	DC component only.
⌇	Inductive phase shift.
⌇	Capacitive phase shift.
°	Degree.
-.+	Expert mode.
⎮ ⎮	Absolute value.
Φ_{VA}	Phase shift of the phase-to-neutral (phase voltage) voltage with respect to the phase-to-neutral current (line current).
Φ_{UA}	Phase shift of the voltage phase-to-phase (line voltage) with respect to the phase-to-neutral current (line current). Two-wire two-phase mode only.
Σ	Value of the system.
%	Percentage.
%f	Fundamental value as reference (percentage of the fundamental).
%r	Total value as reference (percentage of the total value).
A	Phase-to-ground current (line current) or the unit "ampere".
A-h	Harmonic in current.
Acf	Peak factor of the current.
Ad	RMS distortion current.
Adc	DC current.
Apk+	Maximum peak value of the current.
Apk-	Minimum peak value of the current.
Arms	RMS current.
Athd	Total harmonic distortion of the current.
Athdf	Harmonic distortion of the current with the RMS value of the fundamental as reference.
Athdr	Harmonic distortion of the current with the total RMS value without DC as reference.
Aunb	Negative-sequence current unbalance rate.
AVG	Mean value (arithmetic mean).

Blackout: fall of voltage, at some point in the power network, to below a specified threshold.

BTU	British Thermal Unit.
CF	Peak factor (Crest Factor) **in** current or voltage**:** ratio of the peak value of a signal to the RMS value.

Channel and phase: a measurement channel corresponds to a difference in potential between two conductors. A phase is a single conductor. In polyphased systems, a measurement channel may be between two phases, or between a phase and neutral, or between a phase and earth, or between neutral and earth.

cos Φ	Cosine of the phase shift of the voltage with respect to the current (displacement factor – DPF).
D	Distortion power.

Dip threshold: specific voltage used to define the beginning and end of a voltage dip.

DC	DC component (current or voltage).
Dh	Distortion energy.

DPF	Displacement factor (cos Φ).
E	Exa (10^{18})
FK	K factor. Used to quantify the effect of a load on a transformer.
FHL	Harmonic loss factor.
Flicker	a visual effect of voltage variations.
Frequency	number of full voltage or current cycles in one second.
Fundamental component:	component at the fundamental frequency.
G	Giga (10^9)
Harmonics	in electrical systems, voltages and currents at frequencies that are multiples of the fundamental frequency.
Hysteresis	difference between thresholds for reciprocal changes of state.
Hz	Frequency of the network.
J	Joule
k	kilo (10^3)
L	Channel (Line).
m	milli (10^{-3})
ms	millisecond.
M	Mega (10^6)
MAX	Maximum value.
MIN	Minimum value.
N	Non-active power.
Nh	Non-active energy.
Nominal voltage:	Reference voltage of a network.
non-nuclear toe:	non-nuclear tonne oil equivalent.
nuclear toe:	nuclear tonne oil equivalent.
Order of a harmonic:	ratio of the frequency of the harmonic to the fundamental frequency; a whole number.
P	Peta (10^{15})
P	Active power.
Passband	range of frequencies in which the response of a device exceeds some specified minimum.
Pdc	DC power.
Pdch	DC energy.
PF	Power Factor: ratio of active power to apparent power.
Ph	Active energy.
Phase	temporal relationship between current and voltage in alternating current circuits.
PK	**or** PEAK**.** Maximum (+) or minimum (-) peak value of the signal.
PLT	Long-term severity. The device calculates its PLT over 2 hours.
PST	Short-term severity. The device calculates its PST over 10 minutes.
Q_1	Reactive power.
Q_1h	Reactive energy.
RMS	RMS (Root Mean Square) value of current or voltage. Square root of the mean of the squares of the instantaneous values of a quantity during a specified interval.
S	Apparent power.
S-h	Harmonics in power.
Sh	Apparent energy.
Temporary surge at industrial frequency:	temporary increase in voltage at some point in the power network, to above a specified threshold.
t	Relative date of the Time cursor.
T	Tera (10^{12})
tan Φ	Tangent of the phase shift of the voltage with respect to the current.
toe	Tonne oil equivalent (nuclear or non-nuclear).
THD	Total Harmonic Distortion. The total harmonic distortion represents the proportion of the harmonics of a signal with respect to the fundamental RMS value (%f) or with respect to the total RMS value without DC (%r).
U	Phase-to-phase voltage (line voltage).
U-h	Harmonics in phase-to-phase voltage (line voltage).
Ucf	Peak factor of the phase-to-phase voltage (line voltage).

Ud	Phase-to-phase RMS distortion voltage (line voltage).
Udc	Phase-to-phase DC voltage (line voltage).
Uh	Harmonic of the phase-to-phase voltage (line voltage).
Upk+	Maximum peak value of phase-to-phase voltage (line voltage).
Upk-	Minimum peak value of phase-to-phase voltage (line voltage).
Urms	Phase-to-phase RMS voltage (line voltage).
Uthd	Total harmonic distortion of the phase-to-phase voltage (line voltage).
Uthdf	Harmonic distortion of the phase-to-phase voltage (line voltage) with the RMS value of the fundamental as reference.
Uthdr	Harmonic distortion of the phase-to-phase voltage (line voltage) with the total RMS value without DC as reference.
Uunb	Negative-sequence unbalance rate in phase-to-phase voltage (line voltage).
V	Phase-to-neutral voltage or the unit "volt".
V-h	Harmonics in phase-to-neutral voltage (phase voltage).
Vcf	Peak factor of the phase-to-neutral voltage (phase voltage).
Vd	Phase-to-neutral RMS distortion voltage (phase voltage).
Vdc	Phase-to-neutral DC voltage (phase voltage).
Vpk+	Maximum peak value of the phase-to-neutral voltage (phase voltage).
Vpk-	Minimum peak value of the phase-to-neutral voltage (phase voltage).
Vh	Harmonic of the phase-to-neutral voltage (phase voltage).

Voltage dip: temporary fall of voltage, at some point in the power network, to below a specified threshold.

Voltage unbalance in a polyphased electric power network: state in which the RMS voltages between conductors (fundamental component) and/or the phase differences between successive conductors are not all equal.

Vrms	RMS phase-to-neutral voltage (phase voltage).
Vthd	Total harmonic distortion of phase-to-neutral voltage (phase voltage).
Vthdf	Total harmonic distortion of phase-to-neutral voltage (phase voltage) with the fundamental RMS value as reference.
Vthdr	Total harmonic distortion of phase-to-neutral voltage (phase voltage) with the total RMS value without DC as reference.
Vunb	Negative-sequence unbalance rate in phase-to-neutral voltage (phase voltage).
Wh	Watt-hour.

17. MAINTENANCE

⚠ **Except for the battery and the memory card, the instrument contains no parts that can be replaced by personnel who have not been specially trained and accredited. Any unauthorized repair or replacement of a part by an "equivalent" may gravely impair safety.**

17.1. CLEANING THE CASING

Disconnect the unit completely and switch it OFF.

Use a soft cloth, dampened with soapy water. Rinse with a damp cloth and dry rapidly with a dry cloth or forced air. Do not use alcohol, solvents, or hydrocarbons.

17.2. MAINTENANCE OF SENSORS

Current sensors must be maintained and calibrated as follows:
- Clean with a sponge and soapy water, rinse with a sponge and clean water, and dry rapidly.
- Keep the air gaps of the clamps (MN93, MN93A, C193, PAC93 and E3N) perfectly clean using a cloth. Lightly oil visible metal parts to avoid rust.

17.3. REPLACING THE BATTERY

⚠ For safety reasons, replace the battery only with the original model (see §19.3).

⚠
- **Do not throw the battery into a fire.**
- **Do not expose the battery to a temperature in excess of 100°C.**
- **Do not short-circuit the terminals of the battery pack.**

Remove the old battery.
- ⚠ To eliminate all risk of electric shock, disconnect the power supply cord and measurement leads of the device.
- Turn the device over, raise the stand, and prop it up against the small yellow stops.
- Use a coin to unscrew the two quarter-turn screws on the back of the housing.

Small yellow stops.
- Using a flat screwdriver, remove the cover from the compartment.

- Turn the device over and hold the battery as it slides out of its compartment.
- Disconnect the battery connector without pulling on the wires.

Note: The Qualistar+ preserves the date-time function for approximately 4 hours without the battery.
The Qualistar+ preserves an inrush current capture for approximately 2 hours without its battery.

Spent batteries must not be treated as ordinary household waste. Take them to the appropriate recycling collection point.

Fitting the new battery.

- Connect the new battery. The connector is error-proofed to prevent reversals of polarity.
- Place the battery in its compartment and arrange the wires so that they do not protrude.
- Put the battery compartment cover back in place and screw the 2 quarter-turn screws back in.
Warning: If the battery is disconnected, it must then be fully recharged, even if it is not replaced, so that the device will know the battery charge condition (this information is lost when the battery is disconnected).

17.4. REPLACING THE SCREEN FILM

Proceed as follows to replace the screen film of the device:

- Remove the old screen film.
- Remove the protection plastic film from the new screen film using the white tab.
- Place the adhesive side of the film against the screen of the device. Smooth the film with a clean cloth to remove any air bubbles.

17.5. MEMORY CARD

The device accepts SD (SDSC), SDHC, and SDXC type memory cards. Before withdrawing or inserting the memory card, make sure that the device is disconnected and off.

17.6. METROLOGICAL CHECK

⚠ **Like all measuring or testing devices, the instrument must be checked regularly.**

This instrument should be checked at least once a year. For checking and calibration, contact one of our accredited metrology laboratories (information and contact details available on request), at our Chauvin Arnoux subsidiary or the branch in your country.

Note: From the first check of the device, the Information sub-menu of the Configuration menu displays the date of adjustment and the date of the next adjustment, as in the example below:

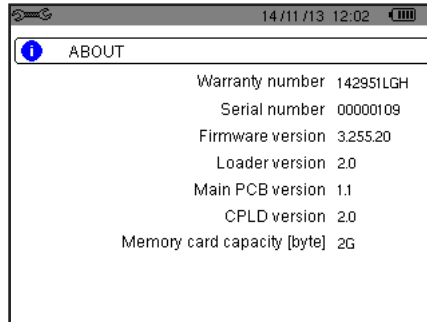

Figure 36: the About menu

17.7. REPAIR

For all repairs before or after expiry of warranty, please return the device to your distributor.

17.8. UPDATING OF THE INTERNAL SOFTWARE

With a view to providing, at all times, the best possible service in terms of performance and technical upgrades, Chauvin Arnoux invites you to update the embedded software of the device by downloading the new version, available free of charge on our web site.

Our site:
http://www.chauvin-arnoux.com
Sign in and open your account.
Then go to "Software support space", then "Freely available software", then "C.A 8336".

Connect the device to your PC using the type A-B USB cord provided.

The embedded software update requires compatibility with the hardware version of the device, indicated in the *About* sub-menu of the *Configuration* menu (see figure 36 above).

Warning: the update of the embedded software erases all data (configuration, alarm campaigns, snapshots, inrush current capture, transient detection, trend recordings. Save any data you want to keep to a PC using the PAT software (see §13) before updating the embedded software.

18. WARRANTY

Except as otherwise stated, our warranty is valid for **three years** starting from the date on which the equipment was sold. Extract from our General Conditions of Sale provided on request.

The warranty does not apply in the following cases:

- Inappropriate use of the equipment or use with incompatible equipment;
- Modifications made to the equipment without the explicit permission of the manufacturer's technical staff;
- Work done on the device by a person not approved by the manufacturer;
- Adaptation to a particular application not anticipated in the definition of the equipment or not indicated in the user's manual;
- Damage caused by shocks, falls, or floods.

19. TO ORDER

19.1. C.A 8336 THREE-PHASE ELECTRICAL NETWORKS ANALYSER

C.A 8336 without clamp **P01160591**

The device is delivered with:
- 1 no. 22 shoulder bag
- 5 black straight-straight safety cables 3 m long attached with a Velcro tie.
- 5 black crocodile clips.
- 1 specific PA 30W mains power unit with mains cord.
- 1 set of 12 inserts and rings to identify voltage phases and leads and current phases and leads.
- 1 USB A/B cord, 1.80m long, with ferrite.
- 1 Power Analyser Transfer (PAT) software.
- 1 checking attestation.
- user's manuals on CD (one per language)
- multilingual safety sheets.

19.2. ACCESSORIES

5 A adapter (three-phase)	P01101959
Essailec® 5A adapter (three-phase)	P01102131
MN93 clamp	P01120425B
MN93A clamp	P01120434B
PAC93 clamp	P01120079B
C193 clamp	P01120323B
AmpFLEX™ A193 450 mm	P01120526B
AmpFLEX™ A193 800 mm	P01120531B
MiniFLEX MA193 250 mm	P01120580
MiniFLEX MA193 350 mm	P01120567
E3N clamp	P01120043A
E3N clamp adapter	P01102081
Mains power unit + E3N clamp	P01120047
Dataview software	P01102095

19.3. SPARE PARTS

9.6 V 4 Ah NiMH battery pack	P01296024
USB-A USB-B cord	P01295293
PA30W mains power unit	P01102057
Screen protection film	P01102059
No. 22 carrying bag	P01298056
No. 21 carrying bag	P01298055
Set of 5 black banana-banana straight-straight safety cables, 5 black crocodile clips and 12 inserts and rings to identify phases, voltage leads and current sensors	P01295483
Set of 12 inserts and rings to identify voltage phases and leads and current phases and leads	P01102080
